

OFTEN FIRST - ALWAYS THE BEST

When we introduced the "S" system last year we knew that we were ahead of the industry. We didn't realize just how far.

WE KNEW THE NEEDS-

When we began designing the S/09 computer, we knew that the normal eight-bit microprocessor system was not adequate for any but the smallest, single user business applications. What was worse there was little that could be done to expand the capabilities of the system if the customer needed it. There is nothing much worse to a business customer than a "dead end" system.

MEMORY IS THE KEY-

Obviously a business system should be able to operate with multiple terminals if needed. It should also be able to do a variety of jobs; not just data processing, but also word processing and computer aided instruction. With a system limited to 64K bytes of memory addresses such a system is just not practical. The amount of user memory available to each terminal is too small for useful work.

HOW DO YOU GET IT-

The common solution to this problem is called bank switching. This process is similar to a selector switch that turns on the bank of memory that you want to work with. This, however, has a few problems. It is inefficient, therefore expensive, plus being slow. It is also extremely clumsy when data must be exchanged between two different programs. Besides with all this you still cannot use more than 64K of memory for any one program. So what is the alternative?

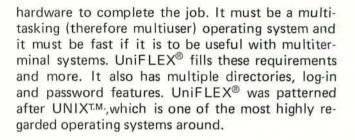

DO IT RIGHT-

The alternative is an address bus with more than the normal 16 bits found on eight-bit microprocessors. By using 20 address bits you can, for instance, address up to a million memory locations directly.

This way you have access to any part of memory at any time without any intermediate processes. Program interaction is now no problem at all.

SOFTWARE MUST MATCH-

So far we have a computer system with a large memory capacity and the ability to operate with many terminals, but this is not enough. You need an operating system just as sophisticated as the

PERIPHERALS TOO-

To complete the system we offer our smart terminals, and a variety of disk systems. We have everthing from a 390K byte floppy to a 40 Meg/ byte Winchester drive. All peripherals are compatible and so you can start with a small single terminal system and upgrade if necessary to a fully expanded system—16 terminals, 768 bytes of RAM memory and 96 Meg/bytes of disk storage.

GET THE WHOLE STORY-

If you are planning to install, or sell business systems you should get our information package on the most versatile and cost effective system on the market, the S/09. You can get a 128K system (less printer) for a little over \$5,000.00.

High-resolution display with alphanumerics

Get the professional color display that has BASIC/FORTRAN simplicity

LOW-PRICED, TOO

Here's a color display that has everything: professional-level resolution, enormous color range, easy software, NTSC conformance, and low price.

Basically, this new Cromemco Model SDI* is a two-board interface that plugs into any Cromemco computer.

The SDI then maps computer display memory content onto a convenient color monitor to give high-quality, highresolution displays (756 H x 482 V pixels).

When we say the SDI results in a highquality professional display, we mean you can't get higher resolution than this system offers in an NTSC-conforming display.

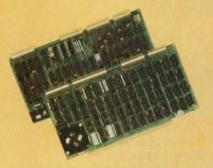

The resolution surpasses that of a color TV picture.

BASIC/FORTRAN programming

Besides its high resolution and low price, the new SDI lets you control with optional Cromemco software packages that use simple BASIC- and FORTRANlike commands.

Pick any of 16 colors (from a 4096-color palette) with instructions like DEFCLR (c, R, G, B). Or obtain a circle of specified size, location, and color with XCIRC (x, y, r, c).

Model SDI High-Resolution Color Graphics Interface

HIGH RESOLUTION

The SDI's high resolution gives a professional-quality display that strictly meets NTSC requirements. You get 756 pixels on every visible line of the NTSC standard display of 482 image lines. Vertical line spacing is 1 pixel.

To achieve the high-quality display, a separate output signal is produced for each of the three component colors (red, green, blue). This yields a sharper image than is possible using an NTSC-composite video signal and color TV set. Full image quality is readily realized with our highquality RGB Monitor or any conventional red/green/blue monitor common in TV work.

Model SDI plugs into Z-2H 11-megabyte hard disk computer or any Cromemco computer

DISPLAY MEMORY

Along with the SDI we also offer an optional fast and novel **two-port** memory that gives independent high-speed access to the computer memory. The two-port memory stores one full display, permitting fast computer operation even during display.

CONTACT YOUR REP NOW

The Model SDI has been used in scientific work, engineering, business, TV, color graphics, and other areas. It's a good example of how Cromemco keeps computers in the field up to date, since it turns any Cromemco computer into an up-to-date color display computer.

The SDI has still more features that you should be informed about. So contact your Cromemco representative now and see all that the SDI will do for you.

Here's the state of the art in low-cost hard-disk computers

11 MEGABYTES OF

FAST HARD-DISK STORAGE

Yes, the Cromemco Model Z-2H is in a class by itself in the computer field.

These Z-2H features tell you why:

- 11 megabytes of hard-disk storage
- 64 kilobytes of fast RAM
- Two dual-sided floppy disk drives
- Z-80A type processor
- Fast 4 MHz operation—150 nanosecond access time
- Fast hard-disk transfer rate of 5.6 megabits/second

Low cost

And that's not all you get. Not nearly.

BROAD SOFTWARE SUPPORT

You also get Cromemco software support-the broadest software sup-

port in the microcomputer field. Software that Cromemco is known for. Like this:

- Structured BASIC
- FORTRAN IV
- RATFOR (RATional FORtran)
- COBOL
- Z-80 Macro Assembler
- Word Processing System

Data Base Management

And more all the time.

FIELD PROVEN

The Z-2H is clearly in a class by itself. We introduced it last summer. It's field proven. It's reliable.

And it's rugged. Housed in a sturdy, all-metal cabinet.

EASILY EXPANDABLE

As always with Cromemco, you get expandability. The fast 64K RAM in this Model Z-2H can be expanded to 512 kilobytes. That amount of RAM combined with 11 megabytes of harddisk storage gives you enormous computer power—the equal or even beyond what much larger computers sometimes offer.

What's more, this computer gives you a 12-slot card cage. That's to plug in your special circuits as well as additional RAM and interface cards.

This expandability is supported by still more Cromemco value — the Z-2H's heavy-duty power supply that gives you 30A at 8V and 15A at \pm 18V to support plug-ins.

LOW COST - SEE IT NOW

The Z-2H is real. It's been in the field for many months. It's proven itself.

You should see the Z-2H now. Contact a Cromemco representative and arrange for a demo. Learn that Cromemco is a survey-winner for reliability.

And learn that the Z-2H is under \$10K.

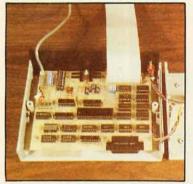

In the long run it always pays to get the best.

Threads of a FORTH Tapestry

Editor's Note: This month's editorial is by BYTE Editor Gregg Williams. Gregg was responsible for the preparation of this month's special section devoted to the FORTH language. Carl Helmers returns next month with an editorial....CM

What do a portable heart monitor, the new Craig Language Translator, a peach-sorting machine, and a movie called *Battle Beyond the Stars* have in common? The answer is FORTH, a not-so-new language as comfortable in industrial machinery as it is in a personal computer. In fact, it was originally used by its inventor, Charles H Moore, to control the telescope and equipment at the Kitt Peak Observatory.

Although I have known about FORTH for about a year, it was only during the preparation of this issue that I began to actively keep my ears open for mention of this unusual language. I have uncovered a lot of information (and some experience) about FORTH and its variations. The language is so unusual that no single line of thought could give you a picture of what the language is like. Instead, the following sections represent several threads from the rich tapestry called FORTH.

FORTH in the Real World

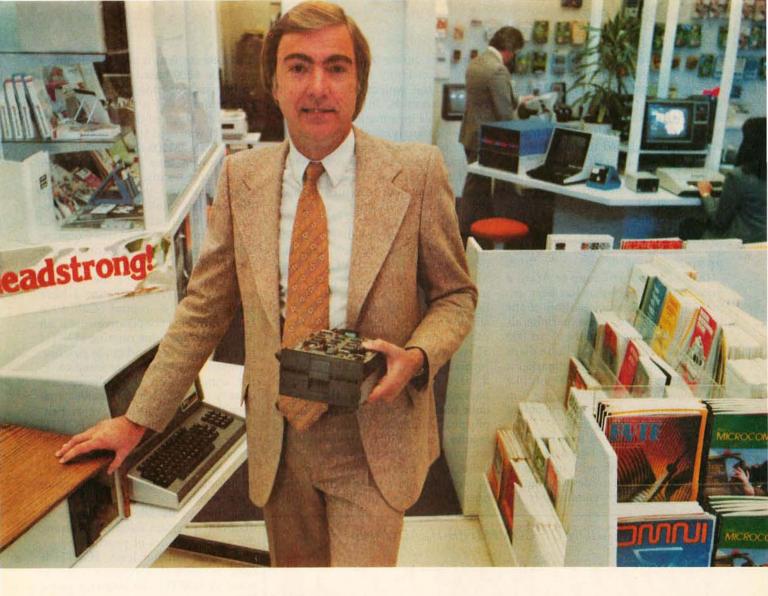

No language I know of is as comfortable in real-world situations as FORTH. Here are some examples of the breadth of applications that have been created using FORTH:

• Elicon Inc of Brea, California, is using FORTH software to drive the same kind of computer-controlled cameras that were used to film the sophisticated space-battle scenes in *Star Wars*. New World Productions of Venice, California, is using this camera system to film the spaceship sequences in the motion picture *Battle Beyond the Stars*. In a related development, Magicam Inc (which devised a number of the special effects for the recent movie *Star Trek*) is in the process of converting control of its master-slave camera pair from an analog computer to a digital computer running FORTH software. In the Magicam process, the master camera follows actors on a special blue stage while the computer guides the slave camera across a detailed model. Later, the two images are optically combined, producing the effect of the actors actually being in the landscape depicted on the model.

• Allen Test Products of Kalamazoo, Michigan, has developed an ignition analyzer for use in service stations and automobile repair shops that analyzes the behavior of automobile ignition systems and displays both diagnostic and corrective information. Formerly, the voltage waveform from a spark plug was displayed on an oscilloscope, after which a mechanic would attempt repairs based on his interpretation of the waveforms.

• Atari Inc is using FORTH in two of its divisions and is rumored to be contemplating other uses for the language. In its Coin-Operated Division,

"For reliable data storage, you can't beat Shugart's Minifloppy."TM Raymond Schlitzer, Owner-Computerland, San Francisco

"I sell systems my customers can depend on. That's why most of the personal and small business computer systems sold here feature Minifloppy disk drives. I know from experience I can rely on the Minifloppy."

Since 1976 Shugart's Minifloppy has been used by more small computer system manufacturers than any other drive. In fact, more than half-a-million Minifloppys have been installed. The Minifloppy looks small—but it stores a lot of data. 250 kilobytes on one side, or up to 500 kilobytes in the double-sided model. That's about 50 pages of printed information on a single-sided Minidiskette, and twice that on the double-sided version. You'll have plenty of storage capacity for your programs, letters, forms, or ledger entries. And you find your data fast, too, because the Minifloppy is a random access device that eliminates the need to search for your data serially as you must with a tape cassette unit.

No matter what problem you're solving with your computer system, you can rely on Shugart's Minifloppy for data storage. We're known as the Headstrong company for good reason. We're Headstrong about reliability, quality, and value. Ask your dealer. He knows us.

which develops and markets the stand-alone games found in pinball arcades and restaurants, a 6502-based development system employs FORTH software to debug and test arcade circuit boards. In addition, Atari has developed its own custom version of the language, called game-FORTH, that is awaiting its first use to replace machine code as the language used to create arcade games. Someday soon, you may play a coinoperated game without knowing that you are actually running a FORTH program.

In the Consumer Group of Atari, a version of FORTH that has been extended to allow manipulation of the video screen and game peripherals has been developed for the Atari 800 computer. Although no definite plans have been made, Atari may market it as an option for the Atari 800, or, like the Coin-Operated Division, use it in a "transparent" mode to implement games and other programs.

• FORTH is used in a portable 1802-based computer that aids in the treatment of patients with infrequent heart flutter. The device, small enough to be worn comfortably by the patient during his or her daily activities, constantly updates a "snapshot" of the patient's heart activity every 7 seconds. In addition to recording this information in real time, the device analyzes the data for evidence of a heart murmur. When a murmur is detected, the device stores the data containing the evidence and signals the patient to return with the device to the doctor's office for analysis and diagnosis.

 In another medical application, FORTH is the sole language used in a computer at the Cedar-Sinai Medical Center in Los Angeles, California. Using FORTH, a Digital Equipment Corporation PDP-11/60 simultaneously performs, among others, the following tasks: manages 32 remote terminals; stores patient information from an optical reader into a large data base; runs a statistical package that analyzes the patient data base in search of trends in the physical makeup, treatment, and results of similar patients; and analyzes blood samples and heart behavior in real time while a patient is exercising on a treadmill machine. Spencer SooHoo, in the pulmonary

medicine section, is also developing a portable 6800-based FORTH system to be used for monitoring intensivecare patients.

• A stripped-down version of FORTH was used to create the handheld Craig M100 Language Translator under time, size, and other design constraints. This same language also runs the software inside the translator unit. In a related product, a hand-held ASCII terminal manufactured by MSI Data Corporation of Costa Mesa, California, also uses FORTH internally.

 In what must be the most interesting FORTH application I have encountered, a central California fruit farming cooperative uses an 8080-based machine running FORTH to adaptively sort and grade peaches. Infrared sensors send information to the computer on the coloring and quality of pitted peach halves that pass the sensors on a conveyer belt. After analyzing this data, the FORTH program causes flippers to knock the peach halves into appropriately graded bins-extra fancy, fancy, etc. In addition, the program keeps track of the percentage of peaches in each bin and changes its selection criteria to maintain a certain fixed ratio among the various grades of peaches.

• Last but not least, FORTH is used in several aerospace applications. A FORTH-like language called IPS (running on an 1802-based system) is orbiting Earth in an amateur radio satellite called the OSCAR Phase III. Avco Inc is using another 1802-based system (again, for the small size and power comsumption of the 1802 microprocessor) to monitor temperature and take care of ground-to-satellite and satellite-toground telemetry in a military satellite.

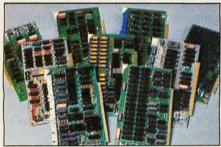

Who Should Try FORTH?

FORTH is an easy language: a high school student, Arnold Schaeffer, wrote an arcade-type game called BREAKFORTH. (See "Breakforth into FORTH," by A Richard Miller and Judy Miller, on page 150.)

FORTH is a difficult language: it easily beats APL as a "write-only language"; you can write a program in the language, but you can't easily read what you've written.

Given these two valid extremes, your initial reaction might be, "This doesn't make sense." True, learning

At Intersystems, "dump" is an instruction. Not a way of life. (Or, when you're ready for IEEE S-100, will your computer be ready for you?)

We're about to be gadflies again. While everyone's been busy trying to convince you that large buses housed in strong metal boxes will guarantee versatility and ward off obsolescence, we've been busy with something better. Solving the *real* problem with the first line of computer products *built from the ground up to conform to the new IEEE S-100 Bus Standard*. Offering you extra versatility in 8-bit applications today. And a full 16 bits tomorrow.

We call our new line Series II.[™] And even if you don't need the full 24-bit address for up to 16 megabytes (!) of memory right now, they're something to think about. Because of all the performance, flexibility and economy they offer. Whether you're looking at a new mainframe, expanding your present one or upgrading your system with an eye to the future. (Series II boards are compatible with most existing S-100 systems and *all* IEEE S-100 Standard cards as other manufacturers get around to building them.)

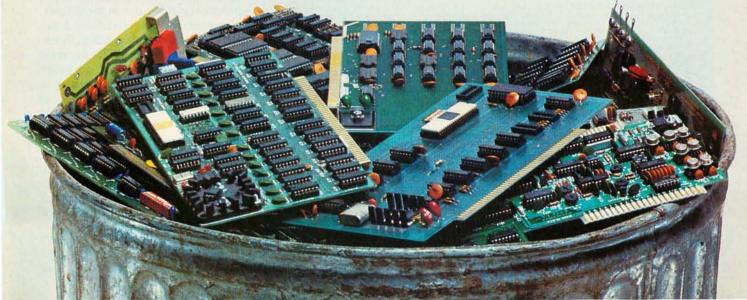

Consider some of the features: Reliable operation to 4MHz and beyond. Full compatibility with 8- and 16-bit CPUs, peripherals and other devices. *Eight* levels of prioritized interrupts. Up to 16 individually-addressable DMA devices, with IEEE Standard overlapped operation. User-selectable functions addressed by DIPswitch or jumpers, eliminating soldering. And that's just for openers.

The best part is that all this heady stuff is available *now*! In our advanced processor—a full IEEE Bus Master featuring Memory Map[™] addressing to a full megabyte. Our fast, flexible 16K Static RAM and 64K Dynamic RAM boards. An incredibly versatile and economical 2-serial, 4-parallel Multiple I/O board. 8-bit A/D-D/A converter. Our Double-Density High-Speed Disk Controller. And what is undoubtedly the most flexible front panel in the business. Everything you need for a complete IEEE S-100 system. Available separately, or all together in our new DPS-1 Mainframe!

Whatever your needs, why dump your money into obsolete products labelled "IEEE timing compatible" or other words people use to make up for a lack of product. See the future now, at your Intersystems dealer or call/ write for our new catalog. We'll tell you all about Series II and the new IEEE S-100 Bus we helped pioneer. Because it doesn't make sense to buy yesterday's products when tomorrow's are already here.

FORTH takes some time: it's somewhat like learning a foreign language. So far, my experiences with FORTH remind me of my attempts at learning a smattering of Russian; both languages are so different from any I've seen before-French or Spanish, BASIC or FORTRAN-that I have to mentally shift gears to work in the new language.

You should give FORTH a try if you are excited by what you see here. Especially important in this respect are the articles, "What is FORTH? A

Tutorial Introduction," by John James, and " A FORTH Glossary," pages 100 and 186, respectively. Your best bet is to get to a computer that can run a version of FORTH; or, better yet, get someone who knows the language to demonstrate it to you.

My first experience with FORTH was at the Fourth West Coast Computer Faire in May 1979. A member of the FORTH Interest Group was demonstrating the language using an Apple II and an Advent television screen. First, he defined a word called

Power One Drive • Camarillo, CA 93010 • Phone: 805/484-2806 • TWX: 910-336-1297 SEE OUR COMPLETE PRODUCT LISTING IN EEM & GOLDBOOK

COUNT, like this:

: COUNT 0 DO I . LOOP ;

Then he said { 6 COUNT } (note: the braces are not part of the expression; see the accompanying text box), the computer replied with { 0 1 2 3 4 5 OK }. I was instantly hooked on learning more about FORTH. What he had done closely paralleled the iota function in APL, and anything that even resembled APL was going to get my full attention.

If you are at all dissatisfied with the capabilities of your current computer, or if you feel that there should be more to computers than BASIC and assembly language, you should try FORTH. Once you get accustomed to its peculiar syntax, you can make it do nearly anything you want it to. In fact, you can even make it have features it did not previously have. Assembly language is like this to some extent, but FORTH is a higher-level language with the same abilities-only magnified. FORTH is what I call a "homebrew" language; its enthusiasts carry with themselves the same look-how-this-works enthusiasm as do most hardware hackers who build their own hardware. If we ever have a homebrew software issue, FORTH will certainly be included.

FORTH is the ultimate software hacker's language because, like a bag of components before a hardware hacker, you can do anything you want to with it. It can be argued that assembly language is the ultimate programming language; strictly speaking, this is true, but it takes so much more time to craft a piece of software in assembly language that it is practically ruled out in most cases.

However, this total freedom carries with it complete responsibility. Since, for example, the FORTH program you write is free to use an array subscript that is out of bounds, you must be responsible enough to either (a) put in error-checking routines (you can take them out later), or (b) build your program up from small tested modules to assure that your program will never execute an improper subscript. If you would rather have the language system do this kind of work for you, stick to BASIC or whatever you're running now.

If you have an Apple* and you want to interface it with parallel and serial devices, we have a board for you that will do both. It's the AIO.™

Serial Interface.

The RS-232 standard assures maximum compatibility with a variety of serial devices. For example, with the AIO you can connect your Apple* to a video terminal to get 80 characters per line instead of 40, a modem to use time-sharing services, or a printer for hard copy. The serial interface is software programmable, features three handshaking lines, and includes a rotary switch to select from 7 standard baud rates. On-board firmware provides a powerful driver routine so you won't need to write any software to utilize the interface.

Parallel Interface.

This interface can be used to connect your Apple^{*} to a variety of parallel printers. The programmable I/O ports have enough lines to handle two printers simultaneously with handshaking control. The users manual includes a software listing for controlling parallel printers or, if you prefer, a parallel driver routine is available in firmware as an option. And printing is only one application for this general purpose parallel interface.

The AIO is the only board on the market that can interface the Apple Two boards in one. to both serial and parallel devices. It can even do both at the same time. That's the kind of innovative design and solid value that's been going into SSM products since the beginning of personal computing. The AIO comes complete with serial PROM's, serial and parallel cables, and complete documentation including software listings. See the AIO at your local computer store or contact

us for more information.

Maybe we can save you a call.

Many people have called with the same questions about the AIO. We'll answer those and a few more here.

Q: Does the AIO have hardware handshaking? A: Yes. The serial port accommodates 3 types-RTS. CTS, and DCD. The parallel port handles ACK, ACK, BSY, STB, and STB.

Q: What equipment can be used with the AIO? A: A partial list of devices that have actually been tested with the AIO includes: IDS 440 Paper Tiger, Centronics 779, Qume Sprint 5, NEC Spinwriter, Comprint, Heathkit H14, IDS 125, IDS 225, Hazeltine 1500, Lear Siegler ADM-3, DTC 300, AJ 841.

Q: Does the AIO work with Pascal?

A: Yes. The current AIO serial firmware works great with Pascal. If you want to run the parallel port, or both the serial and parallel ports with Pascal, order our "Pascal Patcher Disk."

Q: What kind of firmware option is available for the parallel interface?

A: Two PROM's that the user installs on the AIO card in place of the Serial Firmware PROM's provide: Variable margins, Variable page length, Variable indentations, and Auto-line-feed on carriage return.

Q: How do I interface my new printer to my Apple using my AIO card?

A: Interconnection diagrams for many popular printers and other devices are contained in the AIO Manual. If your printer is not mentioned, please contact SSM's Technical Support Dept. and they will help you with the proper connections.

Q: I want to use my Apple as a dumb terminal with a modem on a timesharing service like The Source. Can I do that with the AIO?

A: Yes. A "Dumb Terminal Routine" is listed in the AIO Manual. It provides for full and half duplex, and also checks for presence of a carrier.

Q: What length cables are provided? A: For the serial port, a 12 inch ribbon cable with a DB-25 socket on the user end is supplied. For the parallel port, a 72 inch ribbon cable with an unterminated user end is provided. Other cables are available on special volume orders.

The AIO is just one of several boards for the Apple that SSM will be introducing over the next year. We are also receptive to developing products to meet special OEM requirements. So please contact us if you have a need and there is nothing available to meet it.

Programming Knowledge Is Not Enough

Isaac Newton explained it over 300 years ago. Introductory physics students learn it less than three months into their first course. Yet now it seems to be treated as an argument over words, rather than principles, in BYTE's Letters column. I speak of the description of circular motion under the influence of gravity, and in particular of Delmer Hinrichs' recent contribution "Marsport Forces Resurface" (January 1980 BYTE, pages 16 and 17).

In the situation described, there is only one force acting: gravity, given by GMm/r^2 . The other relation Hinrichs presents does *not* show how to calculate another kind of force, but is simply a statement of Newton's second law of motion, namely, if any net force acts on

a body, an accelerated motion will be observed. For circular motion, the acceleration is equal to v^2/r , and the force giving rise to such motion, from whatever physical source, is called a centripetal force; ie: a force toward the center of the circle, which is quite the opposite of Mr Hinrichs' "centrifugal" force (of which there is none in the situation under discussion). The physics here is thus simply to note that the gravitational force acts centripetally, and thus can be equated to m times the acceleration, or ma.

It is unfortunate that many people have not yet realized that programming, once one is past the initial hurdles, is no longer a self-sufficient discipline, but must be viewed as a tool within the context of some other discipline in order to acquire real value. If the discipline is economics, for example, the programmer must be a reasonably accomplished economist if one is to trust his results; if the discipline is physics, then the physics must be understood thoroughly, and not just pulled out of some handbook; and so on....

More Marsport Commentary

In Delmer Hinrichs' second letter in the January 1980 BYTE, he continues to miss the point about the nature of forces in circular motion. (See "Marsport, Here I Come," April 1979 BYTE, page 84.) As he points out, the National Aeronautics and Space Administration (NASA) explains circular orbits in terms of centripetal force and gravitational force, while Mr Hinrichs says, "The attraction of gravity is exactly balanced by the centrifugal force at all times." This is not just a matter of "slightly different" terminology. As can be confirmed with a dictionary, a centripetal force is one directed toward the center of motion, but a centrifugal force is one directed away from the center of motion. Thus the terminology of Mr Hinrichs is in fact opposite that of NASA.

Perhaps the confusion results from the use of two names, centripetal and gravitational, which suggests the existence of two forces. However, gravita-

High quality. Competitive pricing. And a proven track record.

Three reasons why Percom is the industry's number one independent manufacturer of mini-disk systems for microcomputers.

And if you're looking at mini-disk drives, extra storage capacity is an added bonus.

In fact, you store almost one fifth more data on Percom TFD-100tm drives and over two-and-one-fourth times as much on TFD-200tm drives.

Besides extra testing and superior design, you get free, with each system, a software patch on minidiskette that not only upgrades TRSDOS* for operation with the newer 40- and 77-track drives, but also deglitches version 2.1.

Available in 1-, 2- and 3-drive configurations, Percom drives for the TRS-80* computer start as low as \$399.

tional forces are centripetal; ie: directed toward the center (of Mars in this case). In other words, for circular orbits the gravitational force and the centripetal force are one and the same and cannot balance one another.

You might then wonder why two names and two formulas are used for the same force. The answer is that the two different formulas come from two separate types of analysis, one independent of motion, the other requiring motion. The formula for gravitational force, $F_2 = GMm/r^2$, comes from measurements of forces between two masses. The two masses might be orbiting each other, in contact, on a collision course, or moving apart. The gravitational-force formula works the same in all of these cases. On the other hand, the formula for centripetal force, $F_1 = mv^2/r$, comes from measurements of forces needed to keep a single mass moving in a circular path. These forces can be of any type. Examples include tension in a string, friction between a car's tires and the road surface, electricity, magnetism, and gravity. The centripetal force equation works the same in all of these cases. Notice that both of these formulas apply to circular orbits and can be set equal because the centripetal force is supplied by gravity.

As a high school physics teacher with a Master's degree in physics, I have discussed this subject with over a dozen physicists and hundreds of students. All of the physicists and most of the students would agree with what I have written here.

A Message About the Reminder

My article in the January 1980 BYTE "A Computer-Generated Reminder Message" (page 160) has prompted several people to contact me, raising various questions related to the article.

The data conversion routines caused the most comment. They require a BASIC processor which maintains at least seven full decimal digits of precision; many do not. To determine if a given BASIC maintains seven digits of precision, enter "PRINT 99999999". If "99999999" is printed, the BASIC maintains sufficient precision. References for further study of data-processing algorithms may be found in the following articles:

> Fliegel and Pan Fladen, "A Machine Algorithm for Processing Calendar Dates," *Communications of the*

ACM (CACM), volume 11, October, 1968.

Robertson, "Remark on Algorithm 398," Collected Algorithms from CACM.

Stone, "Tableless Date Conversion," Algorithm 398, *CACM*, volume 13, October, 1970.

Tantzen, "Conversions Between Calendar Date and Julian Day Number," Algorithm 199, *CACM*, volume 6, August, 1963.

The only known error in the January article appears on page 172. The reference to line 9500 should be deleted, since the line was deleted from the program listing.

Another area of questions concerned the conversion of the program to other disk BASIC s. I have been asked about TSC BASIC, North Star BASIC, and other versions. The usual two areas of concern are the required seven digits of precision and disk input/output (I/O) methods. Without reference to specific implementations, Microsoft-like BASICs should prove the easiest to convert. Other implementations which do not use FIELD statements are also convertible, though with some increase in difficulty.

Here's a Good Book on Curve Fitting

In response to F R Ruckdeschel's appeal for a good, balanced reference book on curve fitting (Letters, March 1980 BYTE, page 16), I heartily recommend *Applied Linear Statistical Models* by John Neter and William Wasserman (Richard Irwin & Sons, 1974).

This book features a unified approach to both simple and multiple cases of linear and polynomial regression techniques, and through the use of indicator variables, it also offers a regression approach to basic and multifactor analysis of variance.

It is a good book for both beginners and statisticians alike, since it starts out at an introductory level, introduces matrix theory early, and goes on to show how matrix operations (operations on two-dimensional arrays, which most computer languages can handle) can be applied to a large variety of statistical analyses.

After I had struggled for years in the seemingly muddy area of statistics, this book has been instrumental for me in

Getting Into a Metric Gear

As an avid cyclist, I was glad to see the Programming Quickie in the March 1980 BYTE ("Gear-Ratio Calculation for Bicycle Derailleurs," page 68), but as an ardent proponent of "metrication" I was sorry to see that, contrary to your stated policy, you did not include a metric equivalent. Metric countries use a more rational and intuitively meaningful measure of the gear ratio than our silly system does; they simply measure how far the bicycle will travel in one complete turn of the pedals. The following program (listing 1) should serve to make the principle clear.

Listing 1.

PROGRAM GEARS: CONST PI = 3.14159; VAR DIAMETER CIRCUMFERENCE, DEVELOPMENT, CHAINWHEEL, SPROCKET: REAL; BEGIN WRITE ('WHEEL DIAMETER IN METERS: READ (DIAMETER); CIRCUMFERENCE := PI * DIAMETER; REPEAT WRITE ('TEETH ON CHAIN WHEEL: ') WHEEL: (/ANWHEEL); READLN ('TEETH ON SPROCKET: '); READLN (SPROCKET); DEVELOPMENT := (CHAINWHEEL / SPROCKET) * DIAMETER; WRITELN ('DEVELOPMENT: ', DEVELOPMENT: 4:2, ' METERS.') Beware of Handshakes

If any BYTE readers are thinking about installing a dot-matrix printer in their microcomputer system, I have a friendly warning to pass on: pay close attention to your manufacturer's recommendations, or know the risk you're taking if you ignore them.

For example, North Star Computers, Inc recommends that owners connect the Anadex DP-8000 to the parallel interface of its Horizon computer. But comparing printer specifications, I chose to save a few bucks by building a Heath H-14 line printer for the Horizon's serial interface.

I saved some money: the printer kit cost \$625 plus shipping, plus an additional \$82.98 at the Heathkit Electronic

Center in Seattle when the H-14 flunked its initial power-on tests. The service personnel replaced two defective CMOS (complementary metal-oxide semiconductor) integrated circuits and repaired three open-foil breaks in the 5 V supply at no charge, but they detected erroneous installation of seven transistors. (Considering the obvious textual errors in the documentation, which would you believe—the text or the pictorials? I guessed wrong and followed the pictorial: customer error!)

My H-14 printer tested perfectly at 4800 bps (bits per second) under HDOS in Seattle. It went ape at 4800 bps on the Horizon after I got it home. A quick phone call to my friendly Horizon dealer divulged the fact that North Star DOS does not test for handshaking signals! (The Heath manual advises to run no faster than 110 bps without handshaking.)

So now I have a 110 bps line printer dawdling along, while the 4 MHz Z80A and I are twiddling our respective thumbs! Does anybody out there want to trade an in-warranty Anadex DP-8000 printer for an in-warranty Heath H-14 plus some extra cash?

As a charter subscriber to BYTE, I quite often see references by many of your software reviewers and article writers to the lack of *good* software available for microcomputers in the business field. I thought, to give some perspective, that I would tell BYTE readers about the Electric Log. It is highly specialized and useful in no field other than the operation of a television station; therefore it is directed to a very small group of very small businesses (less than 8000 in the entire US).

The point I would like to make is this: since there is an adequate supply of standard business packages available, the opportunity in business software lies in the specialized application field. These will never be marketed in magazines outside the trade, never by computer companies, and never with any great publicity. There is more of this done than you realize, and this may be the undercurrent that stimulates small business to invest in microcomputers.

Emory Sprenkle remarked in his letter (February 1980 BYTE, page 16) that 1/(113/355) is a good rational approximation of π , and is easily remembered. In fact, 355/113 is the *best* rational fraction approximation to π having no more than three digits in the numerator.

I was reminded of the following problem which appeared a few years ago in *American Mathematical Monthly*:

What is the smallest number of perfect 1-ohm resistors needed to

create a network with an equivalent resistance of π ohms, \pm 10 ⁻⁶ ohms?

This problem leads one to discover how positive rational fractions may be presented as *continued fractions*. The solution shown in figure 1 includes three resistors in series with a network consisting of sixteen series-connected resistors in parallel with seven parallelconnected resistors, making twenty-six in all.

CCS. Industrial standards.

We see the S-100 a little differently.

We mass-produce S-100 products to deliver industrial quality, at industrial prices.

You systems builders who need top quality, full featured, *workhorse* S-100 building blocks at the most competitive prices now have a source. California Computer Systems. Industrial quality means top grade materials, components, and assembly, plus complete testing for absolute reliability.

Industrial quality means solid designs, a full complement of the important features you require, and a product line that delivers performance.

Industrial pricing comes from mass production. We buy at the right prices, and build *in quantity*, using state-of-the-art facilities and techniques. Including complete burn-in, for full performance right off the shelf.

Our industrial point of view means you get higher performance, greater reliability, and lower prices. If these are features you would like to see in your S-100 system, see things our way.

Because for serious users with serious uses for the S-100, these are the industrial standards.

A Build-It-Yourself Modem for Under \$50

Steve Ciarcia POB 582 Glastonbury CT 06033

I receive many personal-computer club newsletters. Some of the larger clubs around the country have put me on their mailing lists to keep me informed of what's going on in their area. One I recently received was significant because it demonstrated the tremendous advancements in personal computing in a very subtle way.

It was not the content of this newsletter that was important. It contained the usual new business, old business, and other information. The significant point was the preparation of the document itself.

According to an editorial, this publication has an editor/publisher and four columnists spread across the state. Each columnist prepares his textual material on his own personal computer, using a word-processing program. He then telephones the editor's computer and down-loads the text to it. The editor, using his computer, combines the four individual

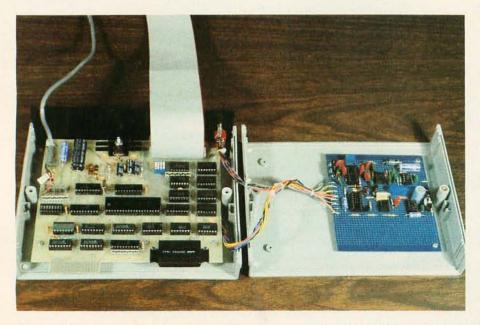

Photo 1: The prototype modem circuit of figure 1 was assembled on the blue perforated circuit board as shown. It was then installed under the top cover of a COMM-80 I/O-expansion unit, shown at left. The COMM-80 was described in the June Circuit Cellar. (See "I/O Expansion for the TRS-80, Part 2: Serial Ports," June 1980 BYTE, page 42.) The COMM-80 and this modem are sufficient to turn a Radio Shack TRS-80, or a computer that uses a similar bidirectional bus, into a timesharing terminal. The modem can be used on any computer.

columns, along with his work, and lays out the complete newsletter. Finally, the editor telephones the print shop and transmits the entire newsletter for typesetting and printing.

The significant point is that all the communication is between computers and is conducted over the telephone lines.

Transmitting and receiving data using the telphone is not a difficult task if you have the correct equipment. Virtually any microcomputer can be configured for this activity. To communicate properly, the system must be a serial terminal or *emulate* one and be attached to the phone lines through a *modem*.

A "terminal" describes any equipment with hardware and software designed to facilitate serial data communication with prescribed data rates and protocol. My June 1980 article on the COMM-80 was such a hardware package. (See "I/O Expansion for the TRS-80" June 1980 BYTE, pages 42 thru 62.) With the COMM-80 attached and using the communication software provided, the TRS-80 computer emulates a terminal. Any other computer system calling itself a "terminal" and using the same data rates and protocol would be able to communicate with it. This includes all users of The Source and MicroNet timesharing services.

A modem is the device that allows the computer to be connected to a telephone.

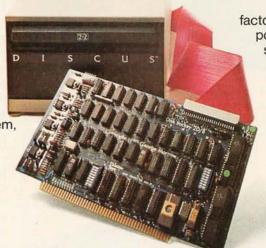

The problems associated with connecting your computer to a telephone

There are two sides to our story.

Side One The DISCUS[™]2+2 Quad - Density Hardware

Now you can use your S-100 system to tackle big jobs. Because the DISCUS[™] 2+2 Quad-Density Disk System puts 1.2 megabytes of fast-access memory on your side for just \$1545.00 complete. With the DISCUS[™] 2+2 System, complete means complete. You get a full-size (IBMcompetible 8th) double sided (

compatible 8") double-sided/ double-density disk drive,

factory mounted in a cabinet with power supply, fully-buffered S-100 single-board controller, and interconnecting cables. All fully assembled, system-tested and fully warranteed. You get the speed and efficiency of 1.2 megabyteper-diskette memory... and you get it for 0.13¢ per byte.

Side Two The DISCUS[™]2+2 Quad - Density Software

1.2 megabyte quad-density hardware is only one side of the story. The DISCUS[™] 2+2 System price includes all the fully-interfaced, high-performance software you need to take full advantage of your quad capacity.

The system includes our exclusive BASIC-V[™] virtual disk BASIC, which allows you to address your quad-

density diskettes as easily as main memory. The operating system you get is the widely accepted CP/M* 2.1. And you get our powerful DISK-ATE text editor/assembler; The most advanced software

development tool available. Micro-Soft BASIC 5.1 and Micro-Soft FORTRAN are available as options. Both run under CP/M* 2.1.

Check out the full system price of DISCUS[™] 2+2 Quad against any other floppy disk system at your local computer store. At \$1545.00, we think you'll take sides with DISCUS[™] 2+2.

Photo 2: Comparison of two generations of modems. At right is an early model made by Anderson-Jacobson, shown with the covers open. The old modem uses discrete semiconductor components and toroidal inductors. On the left is an example of a current model of modem: a Novation Cat acoustic-coupled modem, which is popular with home-computer hobbyists.

Photo 3: First of a series of photos (3 thru 9) showing how you can easily contruct an acoustic-coupler pickup. My design for the pickup uses such "exotic" materials as a hotwater pipe foam insulation, a pair of 2-inch, 8-ohm dynamic speakers, a foam-backed dinner placemat, rubber cement, and adhesive tape.

Step 1 of the process (shown here) is to cut a wedge-shaped piece from the insulating foam. The foam I used had an inside diameter of $1\frac{1}{16}$ inches with a $\frac{1}{2}$ -inch wall, giving an outside diameter of about $2\frac{1}{6}$ inches. The high side of the wedge should have a height of about 1 inch, the low side about $\frac{1}{6}$ inch.

Next, cut and trim a rectangular piece of foam measuring $\frac{1}{2}$ by $\frac{1}{2}$ inches. This is used to help fit the speaker snugly into the hole in the wedge-shaped piece previously cut.

Solder the electrical connections to the speaker before proceeding to apply rubbercement to the rectangular foam piece and wrap it around the voice coil of the speaker. Hold it in place until the cement sets. are not unlike those associated with the cassette data-storage system on a personal computer. Like the telephone, the cassette recorder is incompatible with digital data and has a very narrow bandwidth (a few thousand hertz). Since all personal computers accommodate cassette data storage, there is obviously a reasonable solution.

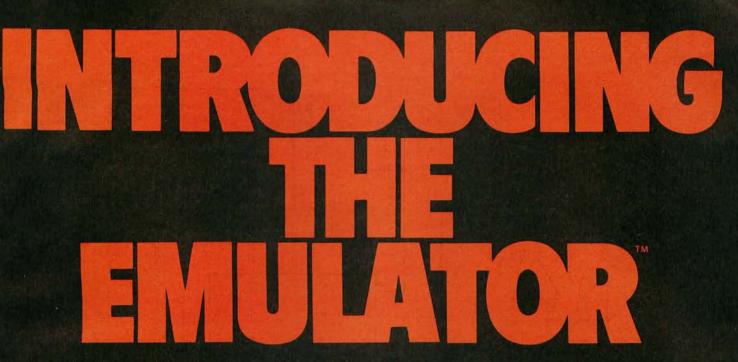

Rather than using digital voltage levels, as in a direct-wired communication link, audio-frequency tones are recorded instead. In most systems, one tone of a given frequency signifies a logic 0 and a tone of a different frequency signifies a logic 1. When we change or shift the tones to correspond with the logic input, we are performing *frequencyshift-keyed* (FSK) *modulation*. When we play back the tape into the computer, a demodulator distinguishes the tones and separates them back into 1s and 0s.

How Does a Modem Work?

Terminal-to-terminal communication is more complex than a simple cassette system even though it employs similar techniques. Transmission over the two-wire phone system from one terminal, called the originating terminal, to another, called the answering terminal, uses FSK tones. The major distinction is that terminals, unlike cassette recorders, can operate in full-duplex mode and communicate in both directions over the same pair of wires. Rather than using a single pair of tones, which would be confusing if both terminals tried to transmit at the same time, a modem uses two sets of tones

One set of tones (1070 Hz and 1270 Hz) is used by the originating terminal and another (2025 Hz and 2225 Hz) is used by the answering terminal. If your computer were connected to a timesharing computer, your computer would be the originating system and all your data would be sent with FSK tones of 1070 Hz and 1270 Hz for logic 0 and 1, respectively. The timesharing computer would answer you with 2025 Hz (logic 0) and 2225 Hz (logic 1) FSK data.

Almost universally, if you are dialing up a large computer network, you are the originating terminal. An originate-only modem, which is all Text continued on page 28

The trouble with video terminals today is that most of the low-cost models just don't have the performance to handle your tough applications. And the few that do are usually not compatible with your existing system. But now, Intertec has resolved this age old dilemma with the introduction of its new Emulator™ Video Terminal.

The \$895* Emulator™ performs exactly as you command. With the depression of just a few keys, Emulator users can select terminal control codes of any one of four popular video terminals. The Lear-Siegler ADM-3A. The Soroc 1Q-120. The DEC VT-52. Or the Hazeltine 1500. Incredible! It's like having four terminals for the price of one. But, best of all, not only does the Emulator replace these terminals, it outperforms them by offering enhanced useroriented features. Features that those other terminals just don't have - at any price.

Standard Emulator™ features include: a sharp, crisp 12" non-glare screen with a full 24 line by 80 column display. Twin RS232C serial ports - one for the host computer and one for your printer. Four separate cursor control keys. A separate 18 key numeric pad. Keyboard selectable baud rates and operating modes. And, a host of visual attributes.

No matter which dumb or smart terminal you're using today, don't buy another until you check out our new Emulator™. You'll get the performance of four terminals for the price of one. And you'll probably save hundreds of dollars over the price you paid for your last terminal. Plus, you'll get unparalleled reliability, nationwide service and quick delivery. Call or write us today for all the details. Intertec terminals are distributed worldwide and may be available in your area now.

RS-232C compatibility is not needed, the LM741 operational (op) amplifier shown as IC7 can be omitted from the circuit. If a crystal microphone is used, instead of the voice-coil speaker, the op amplifier IC1 might be unnecessary. Components were chosen to operate from power supplies of +12 V and -12 V. The circuit can be made to work for supplies within the range of ± 5 V to ± 18 V; however, the resistor network associated with IC7 may

Now! North Star Application Software!

North Star now offers application software for use on the HORIZON! Now you have one reliable source for both hardware and software needs! The first packages available are:

NorthWord-

NorthWord is a simple-to-operate word processing system designed for use with the popular North Star HORIZON. NorthWord enables you to increase office efficiency and cut document typing time and cost. NorthWord incorporates the most sought-after word processing features: easy editing, on-screen text formatting, simultaneous document printing, and much more. NorthWord can be integrated with other North Star software packages to produce customized letters, labels and reports quickly and efficiently.

MailManager-

MailManager enables you to compile and maintain complete organized mailing lists. Lists are easily accessible and can be compiled with a great deal of flexibility. Entries, corrections and deletions are easily made. The North Star MailManager can print your list on individual envelopes, on mailing labels, or in compact summary form.

InfoManager-

InfoManager is a powerful listoriented, data management system. It will accept up to 50 categories of information for each record and has the ability to select and sort before printing. The North Star InfoManager has power and flexibility for many applications: product inquiry, inventory, customer/client records, calendar reminders, and as an easy way to fill in often-used forms.

GeneralLedger-

General Ledger and Financial Reporting, two programs in one, maintains general ledger accounts based on such input as checks, bank deposits and journal entries, and uses the information in the general ledger to produce customized financial statements and financial reports.

NorthWord is the central building block for all the North Star application software to follow. Packages now being tested include other accounting and professional application packages. For more information or a demonstration, contact your local North Star dealer.

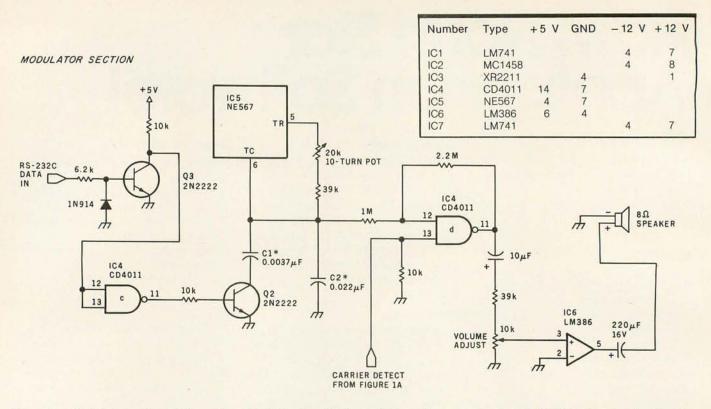

Figure 1b: Modulator section of the modem circuit in schematic form. The tone frequency for a mark (1270 Hz) is set up by choosing the proper values for capacitor C2 and adjusting the 20 k-ohm potentiometer. When transistor Q2 gates capacitor C1 in parallel with C2, the oscillator frequency changes to 1070 Hz.

Capacitor C1 (0.0037 μ F) may be formed from a parallel combination of two components, a 0.0015 μ F and a 0.0022 μ F part. For use in the answer mode, the proper value for capacitor C1 is 0.001 μ F, and the value for C2 is 0.01 μ F.

If RS-232C communication is not a necessity, transistor Q3 may be omitted from the circuit.

you need in this instance, has a 1070/1270 Hz modulator and a 2025/2225 Hz demodulator. On standard dial-up telephone lines the acceptable speed limit is 300 bits per second (bps).

An answer modem is necessary when someone else calls you and chooses the originate frequencies for

himself. In the answer mode, the modulator uses 2025/2225 Hz and the demodulator uses 1070/1270 Hz.

The choice is arbitrary: either modem can use originate mode or answer mode so long as they don't both use the same mode. Owning an originate-only modem is not a handicap as long as someone trying to communicate with you can set his modem to the answer mode to accommodate you.

The modem attaches to the serial input/output (I/O) port on the computer. Most serial ports use the RS-232C protocol, and most commercial modems also use RS-232C. While there are various handshaking requirements listed in the complete RS-232 specification, for the most part handshaking is ignored in simple full-duplex modem applications. Usually the only signals required for operation, beyond the data itself, are Carrier Detect and Data Set Ready.

national timesharing network or phone any of a hundred computerinformation services on your personal computer is a significant milestone. When connected to these systems, you go beyond the hardware limits of the personal computer and instantly add large-computer capabilities. Figure 1 is the schematic diagram of a 0-to-300 bps originate modem which meets all the requirements for communicating with these systems. The prototype is shown in photo 1, mounted under the top cover of the COMM-80 serial/parallel interface.

There are two kinds of modems: direct-connect and acoustic-coupled. The former type requires attachment to the telephone wires through a datacoupler transformer. The latter type, the use of which has fewer legal strings attached, employs an acoustic coupler. This is nothing more than a speaker and microphone that sit under the mouthpiece and earpiece of the telephone handset. The speaker transmits the modem's output tones

Photo 5: Adding pliable material to produce a tight fit around the phone handset. I found a plastic placemat at a discount store with a $\frac{1}{4}$ -inch foam backing that was perfect. Cut a strip $1\frac{1}{2}$ by 8 inches and glue this around the outside of the wedge as shown. Trim to the exact circumference and cover with a strip of fabric adhesive tape. The latter helps hold everything together.

into the telephone, and the microphone listens for the other terminal's response.

Modems vary in complexity. Fifteen years ago they were very expensive and contained many discrete, precision components, including many toroidal inductors for the filter circuits. Photo 2 shows, on the right, an old Anderson-Jacobson modem. Newer technology is shown on the left: the Novation Cat, which is probably the most popular acoustic modem around. The reduction in size is accomplished through integratedcircuit technology.

Figure 2 is a block diagram of the modem circuit in figure 1. The design I am presenting takes advantage of advanced technology and uses only six integrated circuits for the complete modem. Two additional RS-232-converter devices can be added if RS-232C interfacing is required.

The modem is divided into two sections: modulator and demodulator. It also features carrier detection and automatic muting. A light emitting diode (LED) lights to signify that the answering modem is on the line and connected when the 2025 Hz tone (the "carrier") is detected on the line. A signal generated upon detection of the carrier automatically enables the modulator output (of the 1070 Hz tone) in response. Without this feature, the 1070 Hz tone would be blaring out of the speaker continuously.

The modulator section of figure 1b is not very difficult to understand. Tone decoder IC5 (an NE567 device)

The easiest, least expensive way to generate spectacular multi-color graphics, sharp two-color alphanumerics: Your computer, a color tv set and the Percom Electric Crayon[™].

Add the Electric Crayon[™] to your system and your keyboard becomes a palette, the tv screen your medium.

You dab and stroke using onekey commands to create dazzling full-color drawings, eye-catching charts and diagrams.

Or you run any of innumerable programs. Your own BASIC language programs that generate dynamic pyrotechnic images, laugh-provoking animations.

From a combined alphanumerics-semigraphics mode to a high resolution 256- by 192element full graphics mode, the microprocessor-controlled Electric Crayon™ is capable of generating 10 distinctly different display modes.

Colors are brilliant and true, and up to eight are available depending on the mode.

As shipped, the Electric Crayon™ interfaces a TRS-80* computer via your Expansion Interface or Printer

Adapter. It may be easily adapted for interfacing to any computer or to an ordinary parallel ASCII keyboard.

But that's not all

The Electric Crayon is not just a color graphics generator/control-ler.

It is also a complete selfcontained control computer. With built-in provision for 1K-byte of on-board program RAM, an EPROM chip for extending EGOS[™], its on-board ROM graphics OS, and a dual bidirectional eight-bit port — over and above the computer/keyboard port — for peripherals. The applications are endless.

Shipped with EGOS[™], 1K-byte of display memory and a comprehensive user's manual that includes an assembly language listing of EGOS[™] and listings of BASIC demo programs, the Electric Crayon[™] costs only \$249.95.

Options include:

• LEVEL II BASIC color graphics programs on minidiskette: \$17.95.

• A 34-conductor ribbon cable to interconnect the Electric Crayon™ to a TRS-80*: \$24.95.

• RAM chips for adding refresh memory for higher density graphics modes: \$29.95 per K-byte.

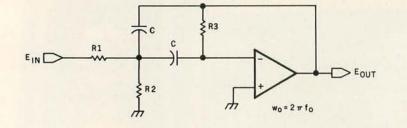

• Electric Crayon™ Sketchpad, a sketching grid of proportioned picture elements (pixels) in a tv aspect ratio. For 128 x 192 or 256 x 192 graphics modes. 11-inch by 17-inch, 25-sheet pads: \$3.95 per pad.

SYSTEM REQUIREMENTS: the video circuitry of the Electric Crayon[™] provides direct drive input to a video monitor or modified tv set. An internal up-modulator for rf antenna input may be constructed by adding inexpensive components to the existing video circuitry.

is configured as a very stable currentcontrolled triangular-wave oscillator. The space frequency (1270 Hz) is determined by the setting of the 20 k-ohm 10-turn potentiometer and capacitor C2. In response to a logic 1 input (inverted from logic 0 by IC4c) transistor Q2 gates capacitor C1 in parallel with C2. The oscillator frequency will now be 1070 Hz. This 567 oscillator, while very stable, has a high-impedance output. One section of the CD4011 NAND gate (IC4d) is used as a high-impedance linear amplifier to match the output of IC5 to the 50 k-ohm impedance input of IC6, the LM386 amplifier. Also connected to pin 13 of the CD4011 is the carrier-detect signal, which mutes the tone output

when no 2025 Hz carrier is being received.

The demodulator section of figure 1a is more complicated and accounts for the major expense in a modem. In an acoustic demodulator there are three basic sections: preamplifier, bandpass filter, and demodulator. Either a crystal microphone or a standard 8-ohm speaker (the latter of which is really about the same thing as a dynamic microphone) can be used with this circuit.

The output of the speaker/mike is amplified by IC1, an LM741. You may not need the gain provided by this circuit $(22 \times)$ if you're using a crystal mike. In that case you should eliminate IC1 and the 10 k-ohm and 220 k-ohm resistors, and feed the microphone output directly to the 6.2 k-ohm resistor leading to IC2. In either case, the signals acquired by the mike are sent through a sharp bandpass filter which passes only signals between 2000 Hz and 2250 Hz.

We use an MC1458 operational amplifier (IC2) to construct a multiple-feedback, second-order bandpass filter. IC2 is configured as two such elements, cascaded to improve response. The mathematical calculations behind component selection in this type of filter are outlined in figure 3. The objective is to pro-

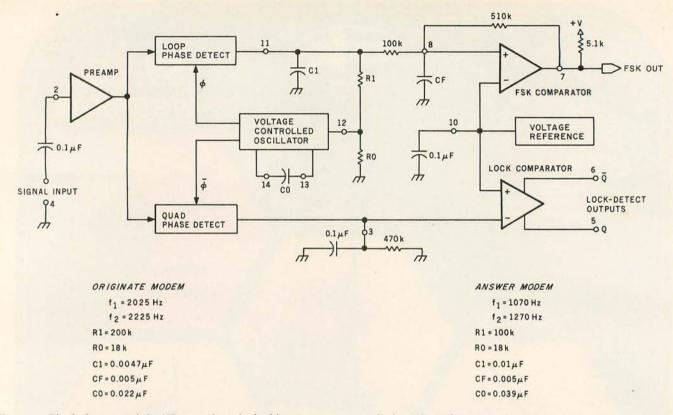

Figure 4: Block diagram of the XR2211 phase-locked loop component, which is IC3 in figure 1a. Appropriate component values for the two modem modes are shown.

duce a filter with a center-ofpassband frequency midway between 2025 Hz and 2225 Hz, with a bandwidth wide enough to allow these two frequencies to pass easily but reject everything else. The computed filter has a center frequency of 2117 Hz, a total gain factor of about 95, and a bandwidth of 300 Hz. When the telephone handset is inserted in the coupler, nothing is passed except the tones we want.

The output of the filter is sent to IC3, which is an XR2211 monolithic phase-locked loop (PLL) especially designed for FSK data communica-

tion by Exar Integrated Systems. Figure 4 presents a block diagram of this device with pertinent external component selection.

A phase-locked loop is basically an electronic servo loop consisting of a phase detector, a low-pass filter, and a voltage-controlled oscillator (VCO). Its function is to synchronize its own oscillator to the incoming signal. If the incoming signal changes, the phase-detector output changes correspondingly to adjust the VCO to track the signal. In the XR2211, if the signal amplitude at the locked frequency is above a minimal value, the FSK comparator signifies this condition with a binary 1 output. The XR2211 can accommodate analog input signals between 2 mV and 3 V.

As shown in figure 1, the components are chosen for originate frequencies, and the XR2211 is powered by +12 V. (The specification says anything between +4.5 V and +20 V is acceptable, but +5 V is marginal in my experience.)

Alignment is simply a case of adjusting the 5 k-ohm potentiometer (R4). With a 2225 Hz signal applied to the microphone input, adjust R4 until pin 7 of IC3 goes low. Changing the input frequency to 2025 Hz

In addition to the FSK output on pin 7, there is a lock-detect output on pin 5, used to denote carrier detection. It is connected to one section of the CD4011. This circuit is a 1-second-on/2-second-off delayedtrigger monostable multivibrator

(one-shot). Either tone (considered the carrier in this case) has to be present for at least 1 second to trigger the circuit into operation, allow data to flow from the modem to the terminal, and turn on the modulator amplifier.

IC7 and Q3 are added for RS-232C interfacing. If RS-232C communication is not a requirement, then these parts can be eliminated. Using the CD4011 (IC4b), the circuit can directly drive one low-power Schottky (LS) transistor-transistor logic (TTL) input load. A CD4049 inverting buffer or CD4050 buffer can be added to drive more input loads if necessary.

Construction Hints

We are dealing with high impedances and critical capacitances in this modem circuit. Layout should be compact, and Mylar or polystyrene capacitors should be used where indicated. Shielded cable should be used between the microphone and the modem board to reduce electrical-noise interference.

The acoustic coupler can be salvaged from an old modem, such as the Anderson-Jacobson unit

For years many small business system buyers thought that in order to get "real" performance and enough storage to be a "real" business system they would have to sacrifice the family jewels.

But with the introduction of the Smoke Signal Chieftain series office computers a lot of people's minds have been changed.

Because we designed the highly reliable Chieftain small business system with the most innovative combination of performance and efficiency around.

At your fingertips there are 64,000 characters of random access memory and you can address anywhere from 740,000 characters to 2 million characters with Smoke Signals's new double density controller. For larger concerns, there's a 20M byte hard disk available.

At a time when other small computer manufacturers tell you "you're on your own", Smoke Signal offers an abundance of easy-to-use software programs such as order entry, inventory control,

accounts receivable, invoice entry, payroll, word processing and much, much more. There's BASIC, COBOL and FORTRAN — even a multi-user BOS (Business Operating System) that allows for numerous users simultaneously.

Chieftain systems starting at under \$200.00 per month display performance on par with systems costing twice to three times as much.

So call (213) 889-9340 for your nearest autho-

OSS CP/A is an all new, disk-based operating system which provides commands and utilities similar to CP/M[®]. CP/A has byte and block I/O, a simple assembly language interface, and direct access via Note and Point. And it's easy to add your own commands or device handlers. CP/A is expandable, flexible, consistent, easy-to-use and available now with compatible program products:

BASIC — Some of the features of OSS BASIC are syntax checking on program entry, true decimal arithmetic (great for money applications), 32K byte string sizes, flexible I/O, long variable names (up to 255 significant characters), and the ability to get and put single bytes.

BUSINESS BASIC WITH PRINT USING — This is virtually the only basic available on the Apple that has PRINT USING. It also has record I/O statements and all the features of our standard BASIC.

EDITOR/ASSEMBLER/DEBUG — OSS EASMD is a total machine language development package. The editor provides functions like FIND, REPLACE, etc. The assembler uses standard 6502 mnemonics, can include multiple files in one assembly, and can place the object code in memory or to a disk file.

Photo 9: With the production of two of the speaker assemblies I have described, we are in business. The one wired to the microphone input of the modem should be placed under the earpiece of the phone, and the one designated as the modem output speaker against the telephone mouthpiece. Dial your favorite computer, place the handset in the coupler, and when you see the carrier-detect indicator light, you are ready to go.

(bought on the surplus market for \$20.00), purchased from the source I listed, or you can make one from readily available materials which cost virtually nothing.

Photos 3 thru 9 illustrate the construction of an acoustic coupler. Both the transmitter and receiver use a 2-inch Radio Shack 8-ohm speaker and such "exotic" materials as foam pipe insulation, a plastic placemat, needlepoint canvas, and rubber cement.

When you are through building the coupler, connect it to the modem circuit and dial your favorite timesharing system. When the telephone connection has been made and you hear the tone, place the handset into the coupler. The carrier-detect LED should light, and you'll be in business.

If you succeed in building the modem and use it to call The Source, send me a message describing your effort. My user-identification number is TCE317.

Next Month: A simple remote dataentry terminal for use in home control applications. Readers who wish to obtain the modem may order the following:

- a complete kit of integrated circuits and components as shown in figures 1a and 1b, a printed-circuit board, and directions for assembly—\$39.95
- two commercially made rubber cushions designed to fit 2-inch speakers, for use in acoustic couplers and two 2-inch speakers—\$12.95
- this modem is available combined with the COMM-80 serial/ parallel interface (June Circuit Cellar) and called the "chatter box." Assembled and tested with software—\$259.95

every smart computer needs an sd systems heart.

We design and manufacture a complete line of industry compatible microcomputer boards and kits that can serve as the heart of your system. All are S-100 Bus compatible and use the Z80 microprocessor.

MPC-4 — This SD Systems exclusive is a multi port controller which uses the Z80 for multi-user operations offering four serial RS-232 I/O channels.

SBC 100/200 — A 2.5/4 megahertz range of single board computers which are effective standing alone or combined with the complete SD board range.

ExpandoRAM I/II — For use with 250/200 nanosecond RAM, these high density boards offer 16 to 64K memory; the ExpandoRAM II can achieve RAM capacities up to 256K using 64K chips.

Versafloppy I/II — A floppy disk controller for up to four drives, supporting single/double density and single/double-sided disk formats.

VDB-8024 — A full function visual display board with a Z80 controller that adds display capabilities to your system.

Prom 100 — A specialty board of SD Systems which allows you to program 2708/2716/2732 proms.

Z-80 Starter Kit — A low-cost entry into the world of microcomputers designed primarily for education and experimentation.

The Ohio Scientific CA-15 Universal Telephone Interface

Gregg Williams, Editor

Imagine the following scenario: a businessman in San Francisco calls his office in Boston. The phone rings four times, then a metallic voice answers.

"Hello," it says, "this is the message service of Morell Pharmaceuticals. If you wish to leave your number, please type it in using your push-button phone. Thank you."

Since the man calling is John Morell, the owner, he knows he can type in a special access code. He types in 999 on the Touch Tone phone. The computer on the other end of the line recognizes this sequence.

"Business status," the metallic voice answers. "Zones 1 thru 8 secure—no intruders. Zones 1 thru 8 report no fire alarms. Do you wish messages?"

Mr Morell types in 9, which stands for yes.

"You had three calls. Mr Morse called at 6:04 PM. Ms Morell called at 7:40 PM. Unidentified caller, phone 555-1501, called at 7:51 PM. Do you wish controls?"

Mr Morell types in another yes.

"Operation?" the computer asks. Mr Morell presses the buttons for the digits 0 and 2.

"Office lights on. Time to turn off?" the computer asks. Mr Morell presses the buttons 1, 0, 4, and 5, instructing the computer to turn the lights off at 10:45 that night.

"Another command?" Mr Morell types in a 6, which stands for no.

"Thank you. Good night," the computer voice says, then hangs up.

Is this another computer user's fantasy? (After all, we know that computers cannot do useful things like start coffee in the morning or water the lawn.) No, the above scene is entirely possible. In fact, I have seen a scaleddown demonstration similar to the above during a recent trip to Ohio Scientific to see its new CA-15 universal telephone interface (UTI).

Description

The CA-15 universal telephone interface (shown in photo 1) is a one-board peripheral device that will fit in any Model C8P, C2-8P, C2-OEM, or C3-series Ohio Scientific computer. The internal organization of the

Touch Tone is a registered trademark of the Bell Telephone System for its dual-tone, multiplefrequency signaling system.

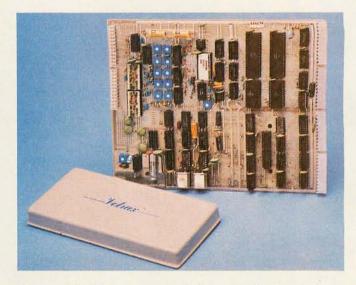

Photo 1: The CA-15 universal telephone interface board, shown with its optional Votrax voice synthesis module.

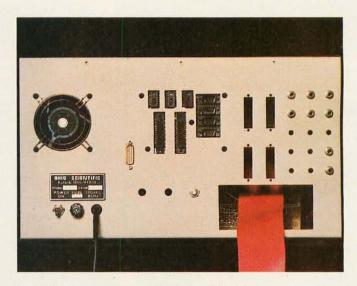

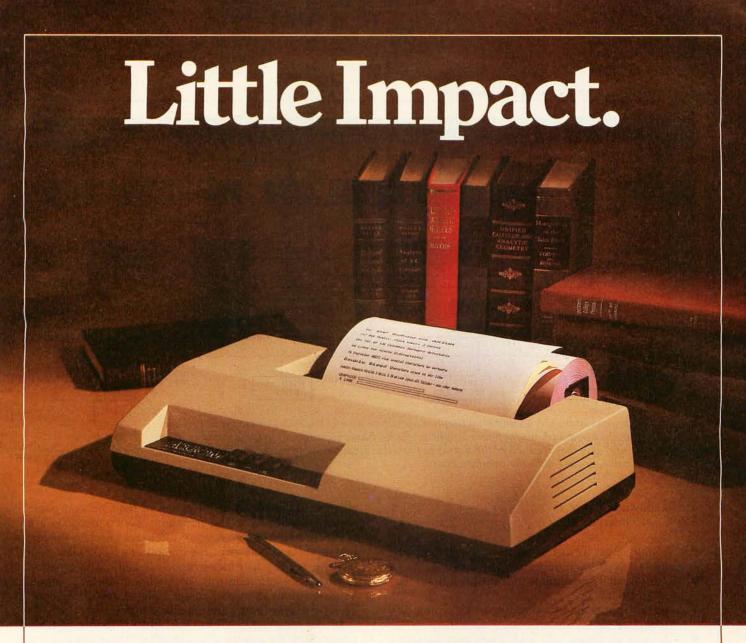

Photo 2: Rear panel of an Ohio Scientific C8P computer, showing connections from the CA-15 universal telephone interface to outside components. The board connects to a CBT-type data coupler through the DB-15 connector (the small gold-colored connector in the center of the back panel). Other connections are made through the six phono jacks in the upper right-hand corner of the back panel. The jacks, listed in row order from left to right, are: cassette-recorder on/off control, phone-line monitor output, Votrax output (if used), cassette-player on/off control, cassette-player input, and auxiliary input.

Meet the IMPs. A pair of stylish 3½ inch high impact printers that will look great on any desk.

Styled for desk top use, these sleek units stand just 3½ inches high, yet the unique fan-cooled printing system can knock out 80, 96 or 132 columns of crisp hardcopy with continuous throughput of one line per second.

A winning pair. IMP-1, with friction feed, can make multi-copies on plain 8½ inch wide paper, or on teletype rolls. In addition, IMP-2 has tractor feed and full forms control, with tractors adjustable from 1 inch to 9½ inches.

Interfaces abound. All IMPs have Centronics parallel and RS232C/20mA serial inputs as standard equipment. But if you need something different, then we make interfaces for just about any system — high speed serial, Apple, Pet, TRS-80, IEEE 488... Versatile, too. 96 ASCII character set is standard. And you can select 6 character sizes, even graphics, under software control. Options include 2K buffering and special character sets.

Service — a big difference. No other printer manufacturer offers Axiom's combination of low cost and nation-wide service and distribution — in the USA and eighteen overseas countries.

Pssst — the price!!! It's low. \$695 for IMP-1. \$795 for IMP-2. And that's the single unit price.

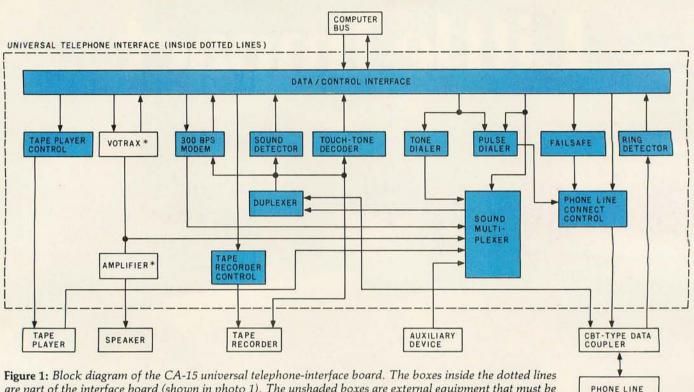

Figure 1: Block diagram of the CA-15 universal telephone-interface board. The boxes inside the dotted lines are part of the interface board (shown in photo 1). The unshaded boxes are external equipment that must be supplied by the user, with the exception of the Votrax module and amplifier (both marked with an asterisk), which are optionally supplied with the interface board.

board is shown in figure 1.

The CA-15 interface can:

- Initiate either Touch Tone or rotary pulse dialing of telephone numbers of any length.
- Use Touch Tone dialing to transmit numeric and control data.
- Sense a phone line ringing (on an incoming call) or a busy signal (on an outgoing call).
- Answer incoming calls and disconnect outgoing calls.
- Act as a 300 bits per second (bps) originate-oranswer modem.
- Play a prerecorded message from an external cassette player onto the phone line.
- Record a voice message onto an external cassette recorder.
- Place audio information (eg: computer-generated music from a digital-to-analog converter) on the phone line from an auxiliary input device.
- Optionally, speak using a computer-controlled Votrax speech synthesizer.

The CA-15 interfaces to the outside world via seven output jacks, as shown in photo 2. The board connects to a dedicated (ie: not used for any other purposes) telephone line through a CBT-type data coupler, which can be purchased from Ohio Scientific or rented from the telephone company. The data coupler is necessary to make a reliable, safe, and legal connection between a computer and the telephone line.

The universal telephone-interface board connects to the external data coupler through a DB-15 connector (the small gold connector in the center of the C8P rear panel shown in photo 2). The remaining six connections are made through the two rows of three jacks each in the upper right-hand corner of the computer's backplane. The jacks, listed in row order from left to right, are: cassetterecorder on/off control, phone-line-monitor output, Votrax output (if used), cassette-player on/off control, cassette-player input, and auxiliary input.

In keeping with Ohio Scientific's "hardware-first" orientation, the interface is controlled through examining and writing to (PEEKing and POKEing, in BASIC) certain memory locations. For example, to dial the three digits 6, 0, 3 (after initializing the interface board), we execute the BASIC instructions:

POKE	63494,189
POKE	63494,215
POKE	63494,190

The documentation supplied with the CA-15 universal telephone interface includes complete instructions that detail manipulation of the interface through reading and writing the appropriate memory locations.

Commentary

Coupled to the security and home-control options available in the Ohio Scientific line of computers, the CA-15 universal telephone interface is the link that extends the influence of a computer beyond its immediate environment. This extended environment includes any point within reach of the existing telephone network. With the Ohio Scientific AC-12P wireless remote-control option, the CA-15 interface can control home appliances

INTRODUCING HP-85. A NEW WORLD OF PERSONAL-PROFESSIONAL COMPUTATION.

Imagine the new world that would unfold before you if you had a powerful, portable, completely integrated computer system at your personal disposal. And at an affordable price. That's exactly what Hewlett-Packard has just created.

THE HP-85: A PERSONAL COMPUTER FOR PROFESSIONALS.

At the lab, on your desk or in your study this 20-pound, self-contained system provides professional computing power when and where you need it. That means no more waiting for data to be remotely processed and returned.

A COMPLETE COMPUTER SYSTEM IN ONE SMALL PACKAGE.

You get all this in the HP-85: Interactive graphics under keyboard control. 16K RAM Memory standard.

Standard typewriter keyboard with separate numeric key pad and eight user-definable special function keys.

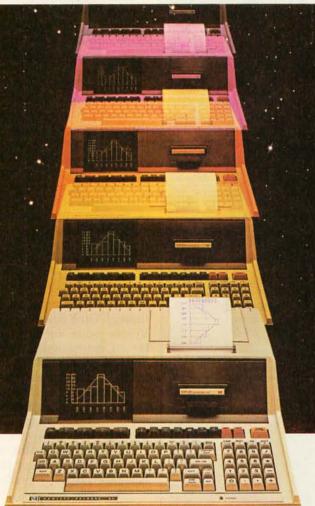

High resolution CRT display with powerful editing capability. Built-in thermal printer produces a hard copy of the display on command. Built-in tape cartridge drive. Each cartridge provides 217K bytes of storage capacity.

Operating system and BASIC language, permanently stored in ROM.

A SOPHISTICATED COMPUTER AT YOUR FINGERTIPS.

Hewlett-Packard has combined these sophisticated capabilities with advanced design to give you a system that is easy to use yet uncompromised in its power.

A key to this achievement is Hewlett-Packard's choice of BASIC for the HP-85's language. The

You can enhance the system's capability by adding powerful HP peripherals like a highspeed, full-width line printer, full-size plotter, or flexible disc drives.

And HP Application Pacs offer preprogrammed solutions in a wide variety of disciplines on prerecorded magnetic tape cartridges.

So, when you buy the HP-85, you're not just buying a computer system, you're buying the confidence that the Hewlett-Packard name brings and the knowlege that the HP-85 can expand with your changing needs.

For the address of your nearest HP dealer, CALL TOLL-FREE 800-547-3400 except from Hawaii or Alaska. In Oregon, call 758-1010. For details on the HP-85, send the attached coupon, or write: Hewlett-Packard, 1000 N.E. Circle Blvd., Corvallis, OR 97330, Dept. 276C

HP-85 has more than 150 commands and statements to let you solve your problems swiftly and easily.

In addition, sixteen graphic commands have been added to the HP-85's extended BASIC to give you easy control of its amazingly versatile graphic capabilities.

DESIGNED FOR TODAY AND TOMORROW.

Whether you're in science, engineering, industry or business, the HP-85 you need today can easily be expanded or customized to meet your needs tomorrow.

You can double RAM capacity to 32K or expand ROM firmware to 80K with optional modules that plug right into the HP-85.

One package does it ALL. Teratek's Postmaster offers the most powerful and flexible mail-management system available for any CP/M or compatible derivative capable of running CBASIC II, now including Apple II.

Menu Driven. Up to 250K Records Per

File Name.

Up to 16 Drives Supported. 9 Digit Zip Code Supported.

Batch Entry: Entering names and addresses to a mailing list is simple. Repeated elements of a record need only be entered once.

Powerful Record Extraction: Used in conjunction with the Optional Reference Field, this feature allows simple creation of user specified "target-files."

Dedicated Record Editor: List, modify or delete records. Allows intact or extracted backup of original file.

Automatic "ID" Field Insertion: (optional) Key in a name, and a unique 10 character record identifier will be entered automatically to the Reference area.

Envelopes: Postmaster prepares single or continuous envelopes.

Mailing Labels: Standard or user-specified formats up to five across. Any number of labels per name.

Prices reflect distribution on 8" single density diskettes. If a formal is requested which requires additional diskettes, a surcharge of 56, per additional diskette will be added. Dealer Inquiries Invited

Translator Program NAD to Postmaster Provided as Full Source.

Form Letters: Supports courtesy titles, nicknames, single page or continuous form. Optional text or salutation inserts in any letter.

Dedicated Record Sorting. Attractive Reports: Neat, paginated reports on either 80 or 132 column paper. Clear, Complete Documentation.

Quality That's Affordable and Available: The Postmaster programs are available in a variety of 5" and 8" disk formats (40k of RAM, CP/M and CBASIC2 are required). Among the formats supported are TRS-80, North Star, Heath H8 and H89, standard 8" IBM, Vector MZ and other CP/M derivatives capable of running CBASIC.

Sample Data Files Included. Powerful Yet Easy to Use. All Output Programs Provided as Full Source.

It's terrific! We use it ourselves!

SUPER-

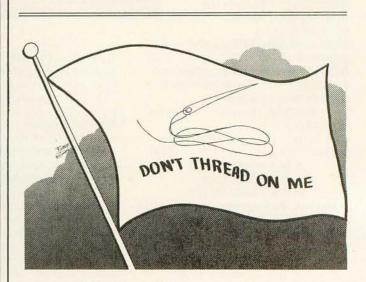

from any Touch Tone telephone. (A dial-type telephone can also be used if the person called has an external device that generates the standard Touch Tones.)

With the AC-17P home-security option, the CA-15 interface allows you to remotely determine whether intrusion, fire, or car alarms have been activated. And, with a sufficiently sophisticated BASIC program running, you can interconnect and control the security and wirelesscontrol options from any telephone.

Other applications that come readily to mind are a sophisticated telephone-answering service (such as the scenario at the beginning of this review) and a standalone terminal, which can be used to call up computer bulletin boards, time-sharing services, and other remote devices.

The CA-15 universal telephone interface requires three power-supply voltages (+5 V, +12 V, and -9 V), while the popular model C4P computer (and its predecessor, the C2-4P) supply only +5 V. Other difficulties include the large number of input and output lines the interface requires and the limited number of slots in the C4P and C2-4P. Because of these problems, the interface cannot be used with the above two machines. However, I was told that an area of the CA-15 board has been left blank (see the bottom center of the interface board in photo 1) for a voltage-doubler circuit that would make its use feasible in the C4P and C2-4P. C4P or C2-4P owners interested in this option should express their interest to Eric Davis at Ohio Scientific, 1333 S Chillicothe Rd, Aurora OH 44202.

The CA-15 universal telephone interface is available through Ohio Scientific dealers for \$499, or \$799 with the Votrax voice module added. A Federal Communications Commission (FCC) approved CBT-type telephone line isolator is available for \$199. Finally, a modified disk BASIC called Security BASIC is available for disk-based Ohio Scientific machines only. It is a modified Microsoft 9-digit-precision BASIC with extensions for the wireless remote-control, home-security, and telephone-interface options; these software extensions replace some of the PEEKs and POKEs otherwise used for device control with BASIC-like mnemonic commands. The Security-BASIC language system is available for \$99.■

A NEW MASTERPIECE IN PRINTERS

The MODEL 800 MST is certainly pleasing to look at, but its true beauty lies beneath the surface. A glimpse at its features reveals why it is rapidly becoming the most sought after printer in the world .

- Four standard interfaces: RS-232 (15 baud rates) Centronics compatible parallel IEEE-488 20ma current loop
- Six line densities: 64, 72, 80, 96, 120, 132
- 100 CPS at all six densities

FATURES

- Unidirectional or bidirectional printing
- Sixteen horizontal and ten vertical tabs
- Elonaated characters in all six densities

inc.

- 1920 character buffer
- Uses either perforated or roll paper
- Fully adjustable tractors to 91/2"
- · Auto self-test

- Up to 10 character fonts Standard 96 character ASCII User defined character font Provision for up to eight additional fonts
- Dot resolution graphics in six densities
- Variable line spacing control from 0 to 64 dots in half-dot increments
- Auto form-feed for any form length at any line spacing
- Heavy-duty all aluminum chassis
- 110vac or 220vac, 50/60Hz.
- 100 million character printhead
- Measures only 15" wide, 3" high, and 11" deep
- Weighs only 15 lbs.
- . . . but maybe its most attractive feature is the price \$699.00.

The Heath H-89 Computer

Mark Dahmke, 1515 Superior St, Apt 15, Lincoln NE 68521

The Heath H-89 is Heath Company's latest in their rapidly expanding line of desk-top computers. The H-89 has a number of unique hardware features, and the same excellent software support and documentation as the original H-8 8080-based system.

Heath Company is promoting the H-89 as the *all-in-one* computer, which it most certainly is. It is based on the Zilog Z80 microprocessor, which makes it upward-compatible with all H-8 8080 software. Not only is the computer based on the Z80, but the video display ter-

Photo 1: The Heath H-89, a Z80-based all-in-one personal computer with built-in 5-inch floppy-disk drive, WH-19 terminal, and 16 K bytes of programmable memory (expandable to 48 K bytes). The price for the assembled unit is \$2295.

Photo 2: Interior of the Heath H-89 computer.

minal and keyboard subsystem also contains a Z80.

The processor board Z80 runs at 2.048 MHz — slightly faster than an 8080 at 2 MHz, but not at the 4 MHz maximum possible with a Z80. Up to 48 K bytes of main memory may be plugged into sockets directly on the processor board, as well as up to six expansion cards on twenty-five pin connectors. The processor board also has single-step and full interrupt logic, a serial RS-232 port that connects to the terminal board, and sockets for three 2708 EPROMs (erasable programmable read-only memories).

The terminal board consists of a Z80, a 6845 video controller chip, two read-only memories, two 2112-2 programmable memory components, an S740 keyboard encoder circuit, and an 8250 UART (universal asynchronous receiver/transmitter) for RS-232 communications. The terminal has a 12-inch video screen that displays twenty-four lines of eighty 5-by-7 dot-matrix characters. The twenty-fifth line is accessible under software control for special applications. Lowercase descenders and thirty-three 8-by-10 dot graphics characters are also provided.

A full keyboard with repeat key (this repeats any key pressed), eight user-definable function keys (see table 1), and a separate numeric keypad are standard on the H-89.

The special function keys generally send out a series of characters such as ESC H for *cursor home*, ESC E for *erase screen*, and so on. Although Heath has its own set of escape functions, the terminal may be placed in the ANSI (American National Standards Institute) mode for a standardized set of the same functions. The numeric keypad actually has three possible modes: the unshifted numeric mode (normal), the keypad shifted mode, and the alternate keypad mode. Table 2 shows the keycodes for each mode. A complete list of escape sequences is shown in table 3.

The ESC r X sequence allows the user to set the data rate from 110 to 9600 bits per second. For example, ESC r C sets the data rate to 300 bits per second.

Another nice feature is the special twenty-fifth line of the screen. This line is separate from the other twentyfour and will not scroll with the rest of the screen. The line may be enabled by sending ESC x 1 from either the computer or the keyboard. After enabling the twentyfifth line, the cursor must be positioned somewhere in the line before writing characters using the direct cursor addressing sequence: ESC Y (line number) (column number) where the line and column numbers are sent as two ASCII characters after the ESC Y. In this case, the line number is 25 + 31 (31 must be added to the actual line and column number values) which is equal to 56 or "8" in ASCII codes. The column number (1 to 80) may range from 32 (ie: 1 + 31) to 111. To position the cursor

MEMORY EXPANSION FOR TRS-80*

Memory expansion. It's a field packed with intriguing theories. For instance, it has been suggested that the memory areas of the human brain are transferable from one body to another, like transplanted kidneys. In man or machine, a larger memory is always a welcome acquisition.

If you are interested in expanding your TRS-80 memory without shelling out dollars for a full blown expansion interface, we have just the solution.

Introducing the MT-32. Our new, brilliantly designed Printer/Memory expansion module for the TRS-80. This unit will add 16K or 32K of dynamic RAM to your basic 16K machine. The module also contains circuitry to drive Microtek's MT-80P dot matrix printer, or any other Centronics-compatible printer.

No hardware modification to your TRS-80 is required. Just plug into your bus connector and you are ready to go.

All Microtek products are covered by a one year warranty.

Four configurations are available:

Without RAM in kit form (MT-32K @ \$79.50)

Without RAM assembled and tested (MT-32A @ \$99.50)

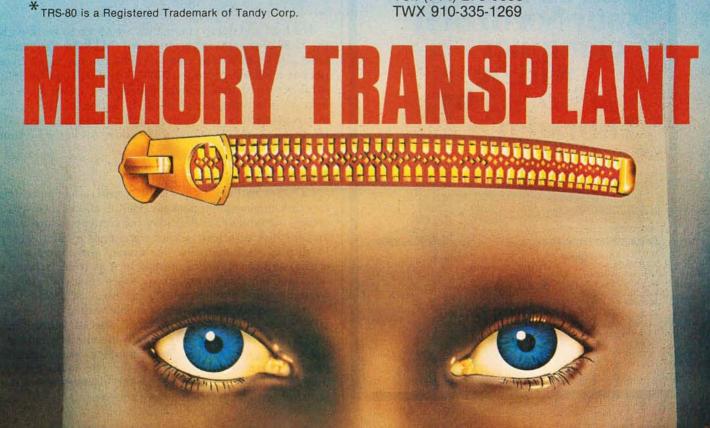

With 16K RAM assembled and tested (MT- 32B @ \$159.50)

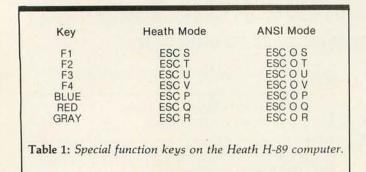

With 32K RAM assembled and tested (MT- 32C @ \$199.50)

Available from Microtek or your nearest computer dealer.

in column 1 of line 25, the following sequence would be entered via the keyboard or sent from the computer: ESC "Y" "8" " ". If the sequence is sent from the keyboard, it is necessary to look up the character equivalents for each value (as above), but if the terminal is driven from a program in BASIC, the process is much simpler:

PRINT CHR\$(27); "Y"; CHR\$(56); CHR\$(32);

Note that the CHR\$(27) causes the ASCII "ESCAPE" code to be sent; 56 and 32 are the line and column numbers, added to 31. The CHR\$ function converts the decimal code number into the corresponding character.

MTR-88 Monitor Program

The H-89 comes with a monitor program in programmable read-only memory that allows the user to operate at machine level or use the system without disk drives (or tape, for that matter). The MTR-88 cassette I/O functions are compatible with the cassette entry points in the PAM-8 front-panel monitor of the H-8, so software written for the H-8 will execute correctly on the H-89.

The monitor supports the following commands:

Boot	Load HDOS from disk.
Dump	Dump a program to cassette tape.
Go	Execute a program at the given address.
Load	Load a program from cassette tape.
Program Counter	Set the program counter address (prior to entering the Go com- mand).
Substitute	Inspect or change memory loca- tions.

The load and dump commands are set up to work with the H-88-5 cassette interface board. MTR-88 also maintains a tick counter in memory. The counter is a 2-byte field at memory addresses 040.033 and 040.034 (in split octal notation) that is incremented by 1 every 2 ms as long as interrupts are enabled. It is possible to assign interrupt vectors for special applications (as with all Heath software) by changing the addresses in the bottom 64 bytes of memory.

HDOS Disk Operating System

HDOS (Heath Disk Operating System) is a comprehensive disk-management package. HDOS allows the user to create, manipulate, and display the contents of disk files and the disk directory. Other commands allow the user to display disk statistics (ie: usage, remaining space, errors) and to set device options such as console/printer data rate, whether or not a back-space cursor function is available on the terminal in use, uppercase or upper/lowercase mode, tabs, console width, and so on. HDOS provides "device drivers," special subroutines which perform all necessary initialization and housekeeping functions for each peripheral interface — console, line printer, alternate console, and so on. The device drivers may be called by the user's program, saving the user the effort of writing device interface routines.

The Microsoft Z-80 SoftCard. Leading a Whole New Lineup for Your Apple II.

Plug the new Microsoft Z-80 SoftCard into your Apple II™ and start using all of the system and application software written for Z-80 based computers. Software that you could never use before on your Apple II.

The SoftCard actually contains a Z-80 processor and lets you switch between the Apple's 6502 and the Z-80 with simple commands, so you can use software written for either processor.

Starting with Two Software Standards. Versatile CP/M," the most widely used microcomputer operating system ever, is included on diskette in the SoftCard package, ready to run on your Apple II.

You get Microsoft's 5.0 BASIC too, the most powerful version to date of our famous BASIC interpreter.

PRINT USING, 16-digit precision, CALL, and CHAIN and COMMON are just some of the major BASIC features you'll add. Applesoft's graphics extensions are still included.

More Power Down the Line. You can get even more programming power and versatility by adding Microsoft's FORTRAN, COBOL, BASIC Compiler and Assembly Language Development System. All are available separately to run with the SoftCard system.

And the whole host of CP/M-based business, scientific and educational applications can be easily transferred to your Apple with SoftCard.

The Microsoft Z-80 SoftCard is compatible with most every Apple product from the Apple II to the Apple II Plus, Language Card and peripherals. Independent peripherals for the Apple are supported as well. The SoftCard package requires a system with 48K and a disk drive.

Line up a SoftCard demonstration at your Microsoft Consumer Products dealer today. They'll be glad to show you how the Z-80 SoftCard and your Apple computer combine to form a system that can't be beat for either practicality or pure pleasure by any personal computer available today. Or give us a call, 206/454-1315, for more information.

But act quickly. At the low price of \$349 for SoftCard, CP/M, Microsoft BASIC and complete documentation, you may have to stand in line to get one!

The H-89, Heath's all-in-one computer, has a number of unique hardware features and the same excellent software support and documentation as the original H-8 system.

The two directory-oriented devices are SY0: and SY1: . On these devices (ie: disks), the directory keeps track of what files exist and where they are. Each file can have an eight-character name with a three-character extension. The extension is useful when keeping track of a number of related files. For example:

> MYPROG.ASM MYPROG.LST MYPROG.ABS

Here the .ASM indicates that the first file is the assembler source of MYPROG entered via the text editor. The .LST file is the listing output of the assembler, and .ABS is the object code resulting from the assembler run.

HDOS Utilities

HDOS also comes with a number of useful utility programs:

PIP	(peripheral interchange program) A generalized disk-file
	maintenance program.
ONECOPY	A program that allows the user with only one disk drive to copy files from one disk to another.
SET	A very useful program that allows the user to redefine device driver configurations. Table 5 lists all options of the SET com- mand.
STAT	Displays system performance, number of disk errors, etc.
FLAGS	Sets disk-file flags to write-protect a file, to suppress normal listing and copying of a file, and (optionally) to lock the file against further flag changes.

DBUG

The Heath console debug program allows the user to enter and debug machine-language programs from the console. DBUG will perform the following functions:

- Display and alter contents of any memory location.
- Display and alter contents of any 8080 processor register.
- Single step through a program.
- Execute a program.
- Set breakpoints in a program.
- Load or dump user programs to or from a device (eg: tape or disk).

Note that DBUG supports only the 8080 register set, not the extra registers in the Z80. Also, DBUG does not have a disassembler feature.

Once in a great while someone comes along with a simple improvement for an already great product. Take our SuperBrain, for example. Really a simple concept. A high-powered, low cost microcomputer packaged in an attractive desk top cabinet. So how do you improve on that?

WE DID IT ...

It wasn't enough that our SuperBrain had such standard features as twin double density 5¼'' drives with over 300,000 bytes of disk storage. A full 32K of dynamic RAM - expandable to 64K in seconds. A CP/M* Disk Operating System which assures compatibility to literally hundreds of application packages presently available. A crisp, 12'' non-glare screen with a full 24 line by 80 column display. A full ASCII keyboard with a separate keypad and individual cursor control keys. Twin RS232C serial ports for fast and easy connection to a modem and/or a printer. And, dual Z80 processors which operate at 4 MHZ to insure lightning-fast program execution. No, it wasn't enough. So we made it better.

ANNOUNCING SUPERBRAIN QD...

Our new QD model has all of the features of our phenomenally popular SuperBrain with the addition of double-sided disk drives and an extra 32K of dynamic RAM. So, for only a modest increase in price, you can order your next SuperBrain with more than twice the disk and memory storage capability. But, best of all, the new QD model has the same tough, rugged construction and exceptional quality that made our SuperBrain such a success.

HOW DID WE DO IT?

The secret of SuperBrain QD's incredible disk storage lies within our new double-density doublesided disk drives. A total of nearly 720,000 bytes of data are formatted on two specially designed 5¼" drives. And that's more than enough to get you started with most serious small business applications. And SuperBrain QD's standard 64K of dynamic RAM will handle even the most complicated programming tasks.

Of course, if you're into megabytes instead of kilobytes, you may think neither SuperBrain is right for you. Not so! Intertec offers 20-96 megabytes of hard-disk storage which connects in seconds to either the SuperBrain or SuperBrain QD. So, your original investment is always protected. As you grow. No matter how much your needs expand.

BUT IS IT RELIABLE?

Our best salesmen are our present users. Not only have SuperBrain users been impressed with the inherent reliability of the system, they tell us that no other microcomputer system available today offers such a unique modular design concept. Just about the only tool required to easily maintain the system is a common screwdriver. And Intertec's total commitment to product service and customer support, with service outlets in most major cities, insures your original investment will be a valuable one for many years to come.

THE DECISION IS YOURS.

Whether your next SuperBrain is a regular model or our QD version, you will have the satisfaction of knowing you purchased what is becoming one of the world's most popular microcomputer systems. And regardless of which model you choose, you'll probably never outgrow it because you can keep expanding it.

So, call or write us today for more information. Intertec systems are distributed worldwide and may be available in your area now.

The Text Editor

The Heath Text Editor is used to enter and edit assembly and BASIC programs, as well as to create and edit reports, letters, and manuscripts.

EDIT uses all available memory in the system as a text buffer. When the buffer is full, all or part of it may be transferred to a disk file. This allows the user to work on files in size up to the limit that will fit on disk. EDIT has a very unusual command format:

<range> <verb> <qualifier string> <option> <parameters>

Range defines the buffer lines the command is to operate on. Characters to indicate certain lines are as follows:

t	Defines the first line of the buffer.
\$	Defines the last line of the buffer.
+	Followed by a decimal number, refers to the <i>nth</i> line past the current line pointer.
÷.	Followed by a decimal number, refers to the <i>nth</i> line preceding the current line pointer.
+ 'string'	The first line in the buffer which con- tains the 'string' after the current line.
— 'string'	The first line in the buffer which con- tains the 'string' preceding the current line pointer.

Multiple line ranges can be specified by using two of the above range expressions in sequence with a comma between them. A blank preceding a verb will cause the command to operate on the entire buffer. An equals sign reuses the range of the last command.

The verb specifies the action to be taken by the editor. Examples are: Print, Replace, Delete, Read, Write, Use, Search, Bye, and so on.

The qualifier string is a further restraint on the range expression and is optional. For example, it is possible to operate on only those lines that contain a phrase or string of characters. If the phrase is entered in single quotes in the qualifier string field, only those lines containing the specified string will be affected.

The option field determines if the current line is to be displayed before it has been modified, after it has been modified, or both. Use of this field is optional.

The parameter field is a special field used to direct disk I/O actions of the editor.

This is the most difficult editor I have ever tried to work with. Even after carefully reading the manual and spending a great deal of time learning how to use it, it is incredibly frustrating. The range and other fields are unconventional and require some getting used to. When writing programs in BASIC, it is far easier to use the line entry and edit commands in the BASIC interpreter. Trying to write assembler programs with this editor is nearly impossible.

Considering all the excellent software and hardware documentation and support of the H-89, and the powerful intelligent terminal features for full-screen editing, it

Suddenly, S-100 microcomputer systems can easily handle 100 million bytes. Because Morrow Designs™ now offers the first 26 megabyte hard disk memory for S-100 systems-the DISCUS M26™ Hard Disk System.

It has 26 megabytes of useable memory (29 megabytes unformatted). And it's expandable to 104 megabytes.

The DISCUS M26™ system is delivered completea 26 megabyte hard disk drive, controller, cables and operating system-for just \$4995. Up to three additional drives can be added, \$4495 apiece. The DISCUS M26™ system features the Shugart SA4008

Winchester-type sealed media hard disk drive, in a handsome metal cabinet with fan and power supply.

The single-board S-100 controller incorporates intelligence to supervise all data transfers, communicating with the CPU via three I/O ports (command, status, and data). The controller has the ability to generate interrupts at the completion of each command to increase system throughput. There is a 512 byte sector buffer on-board. And each sector can be individually write-protected for data base security.

The operating system furnished with DISCUS M26™ systems is the widely accepted CP/M* 2.0.

See the biggest, most cost-efficient memory ever introduced for S-100 systems, now at your local computer shop. If unavailable locally, write Morrow Designs™ 5221 Central Avenue, Richmond, CA 94804. Or call (415) 524-2101, weekdays 10-5 Pacific Time.

The Assembler

The Heath Assembler is a very straightforward, absolute 8080 assembler (not Z80) with most of the standard assembler directives (ie: DB, DS, DW, END, EQU, ORG, SET, TITLE). The XTEXT directive is used to include whole disk files of assembler text into a program. This is convenient if there are some standard symbols or memory addresses that are to be incorporated into every assembler program, such as HDOS definitions. Also, useful subroutines may be included in this way. This feature may be used as a macro-instruction library facility, because the assembler does not allow macro-

"Now you can multiply your computing power as you grow."

Geof Karlin Director of Systems Development

"At ADDS, we've just designed a unique computer family that can take you all the way from small to big.

"We call it ADDS Multivision™–a trio of stacking, CP/M[®]-compatible computers that lets you multiply computing power as needed. Without a change in operating system or programming languages. Without costly conversion. It works like this:

"MULTIVISION 1 (top module) is a get-started computer with 5 MHz processor, 64K bytes of RAM and mini disk storage capacity of 700K bytes. It lists for \$3,785 without terminal.

"MULTIVISION 2 (top and bottom modules) provides 5M or 10M bytes of additional hard-disk storage. Priced thousands less than other hard-disk systems, it lists for \$7,995 with 5M bytes of disk.

"MULTIVISION 3 (entire stack) tops off the line, giving you a multi-user system with up to 256K bytes of RAM that supports up to four display terminals simultaneously.

"We even offer an ADDS-developed package that lets you use Multivision as a word processor.

"Before you decide upon any small computer, look into ADDS Multivision. For years we've been the largest supplier of display terminals to computer giants. Now we're making a system for you."

instruction definitions. A file comes with HDOS called HDOS.ACM. It contains standard HDOS system-call symbols for easily interfacing a user-written program with HDOS and the device drivers.

Extended Benton Harbor BASIC

Extended Benton Harbor BASIC (herein referred to as EBH BASIC) is Heath's own version of BASIC. It is an extension of Dartmouth BASIC with some unique features. One of the first differences I noticed was the command that initiates automatic line numbering while entering programs. In most versions of BASIC it is called AUTO, but in EBH BASIC it is BUILD. The BUILD command works exactly like AUTO. Another important difference is the lack of a RUN "FNAME" command. If the user wishes to execute a program that is on disk as the file "FNAME", the following must be entered:

OLD "FNAME" RUN

To clear the machine of program and data, the command is SCRATCH, not NEW as in most versions of BASIC.

EBH BASIC has some unique and useful commands. (Table 6 lists these special commands and their functions.) But it is not without its problems. Even the most insignificant of syntax errors, such as leaving out a comma or right parenthesis, causes EBH BASIC to display a simple SYNTAX ERROR message. Unfortunately since it has to access a disk file called ERROR-MSG.SYS to get the text of the error message, the user is forced to wait several seconds to find out what he or she probably already knows. The philosophy of storing error-message text on disk to save space in memory is a useful one, but in this case it severely hampers development of programs. The best approach would be to have the most frequently occurring error messages in memory and then access the disk for the remainder.

Microsoft BASIC

Microsoft BASIC is widely used and is very standardized. I will not spend time describing its features.

The Heath implementation of Microsoft BASIC does have one significant fault; when a program is loaded from disk, the disk read head is raised and lowered for each and every sector of the file. This produces an annoying banging sound that seems to go on forever. It is also bad for the drive mechanism and will contribute to the wear and tear of the unit.

Conclusions

The H-89 has flexibility and does not require the user to understand anything about the hardware to take full advantage of all the features. One important point remains: after all the HDOS operating system utilities are put on a single 5-inch floppy disk, there is very little room for any large user programs. To make the system really useful, a second disk drive is a necessity. If the H-89 were to be used in a business with a really large data base, the data would be a tight fit even with two drives.

H-8 Personal Computer with Dual Floppy Disk Storage H-11A 16-Bit Computer with Dual Floppy Disk Storage

H-89 All-In-One Computer with Floppy Disk Storage

Richer in knowledge

Once you build your own computer, you'll know it inside out. You'll know how to make it work for you, how to make it grow as your skills grow.

Richer in savings

Build-it-yourself kits cost less – about 30% less than comparable assembled computers. And you'll probably never need to pay someone for service because no one will know your computer better than you.

Is it hard?

Not at all. Heath makes it simple with easyto-assemble designs and with step-by-step manuals that guide you from unpacking to final plug-in. And a Heathkit helping hand is always just a phone call away.

H-14 Serial Printer

Innovative software

Heath offers you innovative programs for running your home or business, and exciting games for your family. You can have Microsoft™ BASIC™, one of the most powerful and widely used languages.

Heath User's Group (HUG) will share with you a library of over 500 programs to make your computer serve you in ways you never imagined.

Complete hardware

Choose from three computer systems:

The H89 All-In-One Computer gives you everything in one compact, convenient unit.

The flexible H8 gives you the freedom to combine memory and interfacing for exactly the system you require.

And the powerful H11A gives you 16-bit

power for your most complex programs. The Heathkit line includes video terminals, matrix and letter-quality printers and a complete selection of accessories. You'll even find award-winning self-instruction packages to teach yourself programming in BASIC or Assembly.

The Hard-Disk Explosion High-Powered Mass Storage for Your Personal Computer

Tom Manuel 1208 Apollo Way, Suite 502 Sunnyvale CA 94086

High-performance, high-quality, and large-capacity hard-disk drives are now a low-cost reality for your personal-computer system. Most hard disks use *Winchester* media, head technology, and other modern techniques to achieve high density and high performance in a small space. One side effect is low power consumption. Some of the drives suitable for personal computers use the older 14-inch standard diameter platters. Many new drives use one of two new small sizes—200 mm (7.87 inch) or 210 mm (8.27 inch) diameter—and one new drive uses 130 mm (5.12 inch) platters. Even so, their data capacities are significantly larger than floppy-disk drives of the same approximate size.

The latest disk drives can be divided into two general categories:

 low-cost, relatively lowperformance drives that will eventually replace floppy-disk

Photo 1: The Memorex Model 101 hard-disk drive. (Photo courtesy of Memorex.)

drives, especially where multiple drives would normally be necessary to obtain enough storage. For example, instead of adding more floppy drives to increase the storage capacity of a system, one set of dual floppy-disk drives might be replaced with an 8-inch hard-disk drive that fits in the same space. This improves the storage capacity and system performance dramatically. These low-end disk products will compete on a cost-per-drive basis.

high-capacity, top-performance drives that must compete on a cost-per-byte basis. The 8-inch or smaller versions will likely (at least at first) be more costly per byte than the 14-inch models. However, their advantages of small size, light weight, low noise, and low power requirements make them very attractive for desktop and personal computers as well as small business systems.

The Winchester disk-drive technology developed by IBM provided expensive, large-capacity, high-performance, and low cost-per-byte disk subsystems (ie: the IBM 3350 and 3370 disk-drive systems) for large, expensive computer systems. This technology and development in other areas of disk-drive performance are now being applied to the development of products suitable for smaller systems. The tremendous growth of microcomputers has created a de-

What Is Winchester Technology?

Three disk technologies have evolved, all pioneered by IBM. Other manufacturers have refined the designs. These technologies are usually referred to by the model numbers of the original IBM product employing the technology: "2314" technology (in the 1960s), "3330" technology (late 1960s, early 1970s), and "Winchester" technology (1973).

Disk storage, being a special type of add-on memory, can directly affect a computer system's performance, throughput, and reliability. Because of this crucial role, the principal design objectives for disks are large capacity, fast access time, absolute reliability, and low cost.

Each of the three advances has brought a significant increase in storage density. One way to increase density is to reduce the flying height of the heads over the disk surface. Each reduction in height allows an increase in tpi (tracks per inch) and bpi (bits per inch) (see figure 1). Advances in head design and positioning mechanisms have also contributed to increases in tpi and bpi.

Head flying heights have evolved as shown in table 1.

Just prior to 1973, disk-drive technology approached some limits. The flying height had been reduced to 31 microinches. Without further reduction, significant improvement in data density was difficult. At lower flying heights, a single smoke particle, whose diameter may be up to ten times the distance between the head and disk surface, can damage the disk and data. Therefore, cleaner conditions were required. Also, the disk platters and magnetic surfaces were inadequate for large increases in track and bit densities.

The 3340 Winchester disk drive, introduced by IBM in 1973, was the first breakthrough. Storage Technology Corporation announced a similar disk drive around the same time: the STC 8800 superdisk.

Winchester Characteristics

Winchester disk drives have the following characteristics:

- sealed disk, head, and positioning assemblies
- new trimaran head design—two outriggers supporting a narrower inner hull containing the read/write head (see photo 2)

- thinner magnetic coating: 44 microinches versus 185 microinches in the 2314 disk drive
- lubricated disk surfaces
- heads resting on disk surface when drive is stopped—they take off and fly low when motion starts (normal take-off and landing are done on an area reserved for that purpose)
- light loading force (10 g) and lighter heads.

These characteristics permit many performance improvements: very low flying heights (19 to 20 microinches), improved reliability, and a dramatic reduction in head crashes are possible because of the clean environment, new head and loading designs, and lubrication. Data densities are increased because of lower flying height and thinner platter coating. The higher densities improve throughput performance directly. More bits per inch allow more data to pass under the heads per unit time. More tracks per inch mean that track-to-track access times are shorter. The lighter heads and head mounts have less inertia and can be positioned faster. Throughput performance can be improved by increasing the rotational speed, up to a point-the aerodynamic characteristics of the flying head put some constraints on the rotational speed. The reliability of the Winchester drives surpassed that of any moving-head disk drive that was previously available.

Improvements and refinements have continued from many manufacturers. The costs of many of the most expensive elements in a disk (the motor, head actuator, and control electronics) are relatively independent of the capacity of the disk platters. It is, therefore, cost-effective to increase the density of the platters and the number of platters. The incentive has been to add capacity by any conceivable means, and trends have been toward more platters per spindle and greater bpi and tpi densities (data density has gone from about 1000 bpi on early 2314s to over 8600 bpi on some of the recent disks, and tpi density has gone from 200 tpi on 2314s to over 600 tpi on new products). Cost effectiveness has also been enhanced by reducing the access time and increasing the data flow; the economic payoff is increased throughput and efficiency of the total

...Bulk Storage from Industrial Micro Systems

THE NEW MODEL 16

The new Industrial Micro Systems Model 16 Hard Disk Subsystem is a "fixed-removable" high speed, bulk storage device providing from 32 megabytes (32 million characters) to 96 megabytes of on-line storage for the Industrial Micro Systems 8000 or Series 5000 microcomputer systems. The Model 16 includes a credenza enclosure that provides a quiet, strong and

attractive package for office or industrial applications where large memory is required. The Model 16 also includes a fully buffered DMA S-100 bus controller for fast and easy interfacing.

WINCHESTER TECHNOLOGY WITH BUILT-IN BACKUP

The Model 16 includes a 16 megabyte removable cartridge and a 16, 48, or 80

megabyte fixed media that employs Winchester 3340 technology. Files and programs may be copied between the fixed media and the removable cartridge for fast, easy backup and archival storage.

FAST ACCESS

The interface between the Model 16 hard disk and the

Industrial Micro Systems computer is provided by the Hard Disk Controller. The Hard Disk Controller utilizes Direct Memory Access (DMA) for fast data transfer with minimum processor intervention. The maximum data transfer rate is 1.2 megabytes per second and the controller fully buffers the data, a sector at a time, to and from the disk. Available in 220 V, 50 HZ Versions

Manufacturing 2800 Lockheed Way, Carson City, NV 89701 (702) 883-7611 system. In applications where disk storage is a key element, the processor is often disk-I/O-bound. Program execution speed depends on disk speed. Every increase in throughput will improve the total performance.

Other improvements in throughput performance in disk subsystems have

come from RPS (rotational postioning sensing), which frees the disk controller and I/O (input/output) channel for other work during seek time (head actuator movement) and during part of the rotational delay time. Improvements have also included new automatic error detection, correction, and recovery capabilities built into disk controllers.

Voice-coil actuators, described in the next section, are common on high-performance disk drives. There are both linear and rotary voice-coil positioners. Rotary voice coils typically take up less space, require less power, and generate less heat than linear voice coils. Stepper motors with band actuators are usually used in lower-performance, lower-cost disk drives. Many of the new small drives use brushless DC (direct current) motors with direct drive on the platters. Designed as part of the spindles, these motors are compact (about 1 inch high), maintain speed more accurately, use less power, and require simpler power supplies than AC (alternating current) motors with belt drives. In many drives, each recording surface is split into inner and outer bands with a head for each band, reducing the average access time by one-half,

because twice the amount of data can be read or written without moving the heads.

Comparing the New Hard Disks to Floppy-Disk Drives

The current trends toward multiterminal systems, real-time transaction oriented systems, small business systems, and more powerful personal computers for a great variety of applications have created a demand for more on-line data storage. Floppydisk drives and tape cassettes often do not have the required performance (access times, throughput, etc), reliability, or capacities. Thus, the need for secondary storage is being filled by new, inexpensive, highperformance, highly reliable smalldisk drives with capacities, speeds, and reliability close to the very expensive drives. These new drives are physically much smaller and more reliable than 14-inch cartridge or disk-pack drives. They are aimed initially at a gap between floppy drives and 14-inch drives (eg: Winchester, 5440 cartridges and 3330 type packs). They are designed for use on small business systems, distributedprocessing systems, word-processing systems, and advanced personal computer systems.

The new drives offer a lower cost per unit than 14-inch drives, and lower cost per byte than floppy-disk drives. They provide the advantages in capacity and performance of hard disks in a package the same size as an

Multi-User

UniFLEX is the first full capability multi-user operating system available for microprocessors. Designed for the 6809 and 68000, it offers its users a very friendly computing environment. After a user 'logs-in' with his user name and password, any of the system programs may be run at will. One user may run the text editor while another runs BASIC and still another runs the C compiler. Each user operates in his own system environment, unaware of other user activity. The total number of users is only restricted by the resources and efficiency of the hardware in use.

Multi-Tasking

UniFLEX is a true multi-tasking operating system. Not only may several users run different programs, but one user may run several programs at a time. For example, a compilation of one file could be initiated while simultaneously making changes to another file using the text editor. New tasks are generated in the system by the 'fork' operation. Tasks may be run in the background or 'locked' in main *memory* to assist critical response times. Intertask communication is also supported through the 'pipe' mechanism.

Support

ΤM

The design of UniFLEX, with its hierarchical file system and device independent I/O, allows the creation of a variety of complex support programs. There is currently a wide variety of software available and under development. Included in this list is a Text Processing System for word processing functions, BASIC interpreter and precompiler for general programming and educational use, native C and Pascal compilers for more advanced programming, sort/merge for business applications, and a variety of debug packages. The standard system includes a text editor, assembler, and about forty utility programs. UniFLEX for 6809 is sold with a single CPU license and one years maintenance for \$450.00. Additional yearly maintenance is available for \$100.00. OEM licenses are also available.

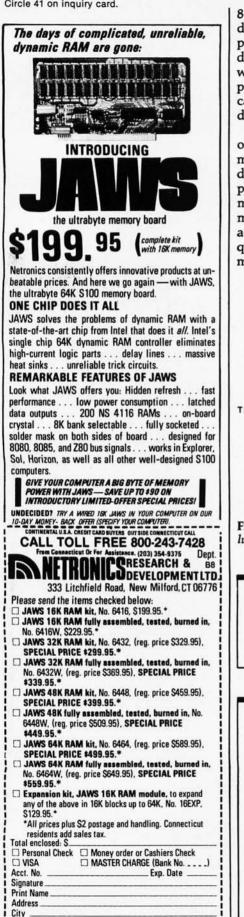

UniFLEX is offered for the advanced microprocessor systems. FLEX, the industry standard for 6800 and 6809 systems, is offered for smaller, single user systems. A full line of FLEX support software and OEM licenses are also available.

8-inch or even a 5-inch floppy-disk drive-many will actually fit the panel openings for floppy-disk drives. Reliability will be better than with floppy and cartridge drives, and power consumption will be significantly lower than that of the 14-inch drives.

Systems based on 16-bit processors or microcomputers often require much more and much faster secondary storage than floppy disks can provide. The more sophisticated multiprogramming and filemanagement software currently being added to small computer systems requires so much continuous use of mass storage that the high perfor-

mance and durability of hard disks may soon be a necessity.

The new 8-inch and 5-inch disk drives offer several advantages over both floppy and 14-inch hard drives:

- They have five to sixty times the storage capacity of a floppy-disk drive in the same space.
- They access data four times faster than the floppy-disk drive.
- They weigh less, take up less space, and use less power than 14-inch drives.
- They are only three to five times more expensive than floppy-disk drives, with cost reductions likely.

The availability of low-cost-perfunction hard disks has long been awaited by the small system marketplace. The wait is all but over. This summer a score of products are scheduled to be available, at least in sample or evaluation quantities.

Though many of the new small disk products are advertised as fitting the same 4.6 by 8.5-inch opening as the standard floppy-disk drive (Shugart Technology's 5-inch Micro Winchester fits a 5-inch floppy-drive opening, see photo 3), a floppy-disk drive cannot literally be pulled out and replaced by the hard drive. To begin with, the packages contain different electronics. Most of the drives

Look what's happened to **HIPLØT**^M DMP-4 \$1.385

It's grown into a complete family of quality low cost digital plotters

In just two short years, The HIPLØT has become the most popular digital plotter among small systems users. With a record like that, what can we do for an encore? WE'VE IN-TRODUCED A COMPLETE LINE OF HIPLØTS ... with a model suited for just about every plotting application.

The HIPLØT DMP Series is a new family of digital plotters with both "standard" and "intelligent" models available with surface areas of $8\frac{1}{2}$ " x 11" (DIN A4) and 11" x 17" (DIN A3). For the user needing a basic reliable plotter, we have the "old standard" DMP-2 (81/2 " x 11") and the "new standard" DMP-5 (11" x 17"). For those needing a little more capability, there are the DMP-3 (81/2" x 11") and houston instrument the DMP-6 (11" x 17")-both

have the basic drive electronics, signal amplifiers, read/write electronics, and motor and servo control circuitry integrated into the package. Some have room to add optional, separately priced controllers to do error-checking and correction, data formatting, and interfacing to the computers.

Stepper-motor actuators are a technique borrowed from floppy drives for use in hard-disk drives. This idea allowed lower prices for Winchester-technology units such as the 14-inch Shugart SA4000 and Century Data Systems Marksman, but at a cost of greater access time and reduced storage capacities when compared with voice-coil actuatorbased units.

A voice-coil actuator is a cylindrical, permanent magnet with a hole machined from pole to pole. A coil rides on bearings within the magnet and moves back and forth. The read/write positioning mechanism with electromagnetic heads is attached to the coil. A voice-coil actuator is positioned by servo-control with servo tracks written on one platter's surface at the factory.

Voice-coil actuators allow increases in data-storage capacity because their accuracy in small movements allows high tpi densities. Since the distance between tracks is smaller, access time is reduced. Also, voice-coil actuators do not impose the additional penalty of settling time.

One disadvantage of a voice-coil actuator is the magnetic field produced by the coil: the coil's magnetic field must not get too close to the disk platters or it could erase them. Efficient design can keep the magnetic field intensity at a safe level near the recording surfaces. Table 2 gives a partial technical comparison between floppy-disk drives and hard disks.

Future Technological Progress

Some of the more recent developments in heads (such as thin film heads) and disks (thin-film-plated disks) mean that data densities will probably advance from the presently attainable 8 to 10 megabytes per 8-inch surface to 50 or more megabytes per surface as track densities of 1000 tpi and bit densities of 10,000 bpi are achieved. A small, relatively inexpensive disk drive could then store 100 megabytes or more of data with an additional 100 megabytes added for nominal cost. Thin-film

The last three or four types are more for the future than now. Bubble memories and nonvolatile integrated circuits will have the great advantage of no moving parts and the potential convenience of plug-in modules; but

they are still quite expensive. At least one interface and controller for American and European standard VCRs (videocassette recorders) is available to provide removable backup for high-capacity disks on small systems (the Corvus Mirror, manufactured by Corvus Systems Inc. San Jose, California). It stores up to 100 megabytes on one videocassette and has a transfer rate of 15 K bytes/second. Video disks have the potential to offer extremely high data-storage capacity and fast access rates (up to 1250 megabytes per 12-inch disk, equal to approximately four times the contents of the Encyclopaedia Britannica).

Small vs Large Hard-Disk Drives

Hard-disk drives for small systems fall roughly into two size categories: up to 12 megabytes and over 12 megabytes; and two performance categories: slow, with stepping-motor positioning, and fast, with voice-coil positioning. Those with steppingmotor positioning have average access times of 70 ms and capacities of under 12 megabytes. The drives with fast voice-coil positioning have average access times ranging from 25 ms to 50 ms, with models that fall into both size categories. The less expensive units are aimed at replacing floppy-disk drives directly. Examples of this type of product are the Memorex 101, the Shugart Associates SA-1000 series, and the Shugart Technology ST 506. The high end is led by IBM with the Piccolo drive. which is integrated into the System 34, and is an add-on peripheral for the Series 1. It features a rotary voice coil, 17 ms average access time, and up to 64.5 megabytes of storage capacity. Other contenders in this category offer high performance in a wide range of sizes (eg: the BASF Systems 6170 Series, IMI (International Memories, Inc) 7700 Series, Kennedy Company 7000 Series, Microcomputer Systems MSC-8000, Micropolis Corporation Micro Disk 1200 Series, Pertec Computer Corporation D-8000, and Priam Diskos 2050/3450).

The disk capacity and the performance you need depend on your particular application, which in turn has a significant impact on the cost of a system. Small-system applications, as

mentioned before, can be placed in two major classes: single-user, single task and multi-user, multi-task.

- Single-user, single-task systems are usually stand-alone workstations, intelligent terminals, or personal computers. Their chief use of magnetic storage, in general, is for program storage and data storage. The amount of storage required is often less than 10 megabytes. Because the speed need only match one human operator's response time, there is no benefit to be derived from disks with extremely fast access times. An average access time of 70 ms is usually sufficient in such applications. This class of application is cost-per-unitoriented, since the storage device is dedicated to one user. It is price-oriented, and performance is not a vital factor. The low-end, small hard-disk drives fill this need splendidly.
- Multi-user, multi-task systems require that more than one, sometimes many, users have access to a common data base.

They typically require from 30 to 100 megabytes of magnetic storage, usually on one spindle. Some require less storage and some will require multiple spindles. The cost per byte of storage is a more important consideration than the cost per drive unit, because the basic device cost is spread over many users.

Multi-user, multi-task systems require an average access time of 50 ms or less because multiple users must contend for the common storage device. The main purpose of these applications is usually not to share the processing power, but rather to share the data. These systems are often "disk-bound" rather than "computerbound." Disk performance becomes a critical factor in system performance. Even when the disk capacity required might be relatively small (8 to 10 megabytes), the fast performance of the high end mini-disks will be required.

With their faster access times, higher capacities, greater reliability and OEM (original equipment manufacturer) quantity prices ranging from

\$1000 to \$5000 (some may soon drop below \$1000), both classes of the new hard-disk drives should be attractive to personal-computer systems builders who want additional capacity and performance, but not the traditional 14-inch disk size and price per unit. Some complete packages of drives, controllers, interfaces, and power supplies are available for about \$5000. Even though they cost five to ten times as much as the processor, these units are still cheaper per drive than 14-inch drives. They are also applicable where more capacity and performance than a floppy disk can supply are needed, but the space or the cost of a 14-inch disk drive is prohibitive. Tables 3, 4, and 5 list some of the current disk-drive products for small systems. The reliability and maintainability of these products are essentially high and are consistent across the board. (See table 6.)

Controllers and Interfaces

One of the problems with the new 8-inch hard-disk drives is the variety of interface systems to choose from. Such variety is inevitable at this stage because of the many personal computers already on the market, and the diversity of interface requirements. In the absence of a comprehensive interface standard, many of the drive suppliers have designed their own. A similar situation has developed in the audio industry. Consider the many types of noncompatible audio recording standards including: the LP (longplaying) record, 45 rpm records, open reel tapes, cassettes, and eight-track cartridges. This kind of variety at the outset of new products is not necessarily bad-there is much freedom for innovation.

In August of 1979 an ANSI (American National Standards Institute) Subcommittee (number X3T9.3) began to standardize an interface for 8-inch hard disks. If a standard interface is widely accepted by the industry, users may soon be able to interface drives from several vendors.

Types of Interfaces

There are two main categories of disk-drive interfaces, *device level* and *host level*. The main characteristics for the device level are:

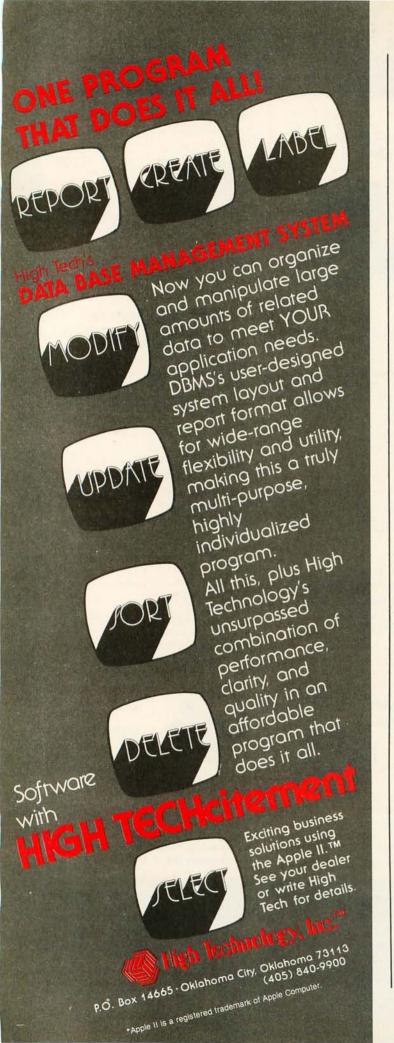

- serial data transfer
 - formatting/de-formatting external to drive Text continued on page 138

Programming Duickies

Self-Reproducing Programs

John Burger, David Brill, Filip Machi, System Development Corporation, 2500 Colorado Ave, Santa Monica CA 90406

Listing 1 is a C program that duplicates itself. When the program is run it produces (on the standard output) a file containing an exact copy of its own source code. This program runs under the UNIX operating system and uses the American Standard Code for Information Interchange (ASCII) character set. If this program is compiled on a system using a different character set, the octal values of "q" and "n" must be changed to the numbers representing that system's codes for the quote and newline (or linefeed) characters, respectively.

Why We Wrote a Self-Reproducing Program

A while back, *Pascal News* contained a listing of a Pascal program called PRINTME that performs this feat. (See reference.) The Pascal listing took 46 lines of code.

We are currently writing a large system in the C language. We considered the Pascal program to be an unstated challenge, and in response we wrote a C version of the PRINTME program that works pretty much the same way as the Pascal version. This version is shown in listing 2.

This version is more elegant than the Pascal version and is 12 lines shorter. It takes a total of decimal 1313 bytes to store the source code. Then, one of us who once had done a lot of LISP programming wrote a LISP function that evaluates to itself. This function takes exactly 279 bytes of memory in which to store the print image of the code. The LISP function is shown in listing 3.

A week or so after the LISP function had been written, we were all discussing the similarities of LISP and C. From this discussion, we developed the C program of listing 1. It works like the LISP function and takes 126 bytes in the source code file.

For purists, though, a still shorter C version can be written. The C compiler, like a LISP compiler, sees all programs as a stream of bytes, and linefeed characters are parsed as spaces. Thus a C program *could* be written all on one line. The program in listing 4 is written on a single line in order to remove the necessity of printing linefeeds in the internal print.

Note that the octal ASCII values for the quote and linefeed characters have been replaced by decimal values (gaining one byte per number) and that all linefeeds except the last have been removed. Our C compiler seems to require at least one linefeed at the end of the file. The source code for this program is only 101 bytes long!

The Evolution of FORTH, an Unusual Language

Charles H Moore FORTH Inc 2309 Pacific Coast Hwy Hermosa Beach CA 90254

Introduction

When I invented FORTH about 10 years ago, my goal was simply to make myself a more productive programmer. When I first worked with computers at MIT and Stanford in the early 1960s, I figured that in 40 years a very good programmer could write forty programs. And I wanted to write more programs than that. There were things out in the world to be done, and I wanted a tool to help me do them. As I worked on programs that ranged from satellite orbits to chromatography to business systems, I developed FORTH in line with my overall goal. For several years now, I have been able to work at ten times my original rate.

As I began thinking of rather drastic improvements to programs, I think I was arrogant. I wanted to do things my way. I was not convinced that I should not be permitted to, and I was a bit hard to get along with. The arrogance was necessary because I felt insecure. I was promoting ideas that everyone said were wrong and that I thought were right. But, if I were right, that meant that all the

About the Author

other people would have been wrong, and there were many more of them And it took a lot of than me. arrogance to persist in the face of massive disinterest.

FORTH is a polarizing concept. There are people who love it and people who hate it. It's just like religion and politics. If you want to start an argument, say, "Boy, FORTH's really a great language."

This is partly because FORTH is an amplifier. A good programmer can do a fantastic job with FORTH; a bad programmer can do a disastrous job. I have seen very bad FORTH code and have been unable to explain to the author exactly why it was bad. There are some visible characteristics of good FORTH, such as very short definitions (many of them). Bad FORTH often takes the form of one definition per block-big, long, and dense. It is quite apparent, but difficult to explain, why or how a FORTH program is bad.

BASIC and FORTRAN are less sensitive to the quality of the programmer. I was a good FORTRAN programmer; I thought that I was doing the best job possible with FORTRAN, but it was not much better than what everybody else was doing. In this sense, FORTH is an elitist language.

On the other hand, I think that FORTH is a language that a grade school child can learn to use quite effectively, if it is presented in bitesize pieces with the proper motivation.

FORTH is the first language that has come up from the grass roots. It is the first language that has been honed against the rock of experience before being standardized. I hesitate to say it is perfect; I will say that if you take anything away from FORTH, it is not FORTH any longer-the basic components are all essential to the viability of the language.

History

What might be called the prehistory of the FORTH language goes back much further than 10 years. The first element of FORTH to exist was the text interpreter, shown in listing 1. This early version, programmed in ALGOL at the Stanford Linear Accelerator Center in the early 1960s, was part of a program called TRANSPORT, which designed electron-beam transport systems. Besides the text interpreter, this printout also shows an early version of the dictionary. The influence of LISP is evident in the indivisible entity (which in FORTH is called a word) named ATOM. As the interpreter reads a word from a punched card, it executes the associated routine, as for DRIFT in this example. The style resembles that of modern FORTH: there is no limit on the length of a word, as you can see by the length of the word SOLENOID, but only the

The best in data base management for your micro-computer

Get the most out of your micro-computer. Use our advanced and progressive data management system.

HDBS is an extended hierarchal data base system offering

- fixed length records
- file-level read/write protection
- one-to-many set relationships

MDBS is a full network data base system offered as an upgrade from HDBS...or it may be ideal as your initial system. Unique and versatile, it adds these features:

- full network CODASYL-oriented data structures variable length records
- multiple levels of read/write protection
- one-to-one, many-to-one, and many-to-many sets
 ono-redundancy of data, easy updating
 occurrences of a record type may own other

- occurrences of the same type a single set may have multiple owner and member record types

MDBS-DRS. As an add-on to MDBS, the DRS system offers extraordinary flexibility in data base restructuring to meet new needs.

 Item, record, and set types can be added, deleted, or renamed in an existing data base as well as other data base characteristics. You can redesign the data base after it is already on-line!

MDBS-RTL. As an add-on to MDBS, the RTL (Recovery Transaction Logging) logs all data base transactions, so that in the event of a system failure, the data base can be recovered with minimal loss of information.

 The recovery processor permits selective reloading of the data base from the transaction file. Users can log messages, indicate complex transaction sequences, and effect selective control over the recovery process.

MDBS-QRS. An interactive Report-Writer/Query-System for MDBS data bases. Features..

- easy data retrieval for non-technical users
- complex retrieval conditions may be specified
- detailed reports can be quickly generated
 wildcard and "match-one" string specifications
- included

HDBS and MDBS Packages Include:

- •DDL data definition language analyzer/editor
- 260-page users manual DMS data management routines callable from host language
- Sample application program and DDL files
- Relocator to re-org all routines
- · System specific manual for bringing up our software

first characters are significant and words are separated by spaces.

Other very early concepts have either changed in form or have evolved dramatically. In listing 2, the word that has become { : } (colon) in modern FORTH is called DEFINE , while END has become { ; } (semicolon). This listing also shows stack operators being defined. As an example of a concept that has evolved, consider the dictionary being sealed by the word SEAL and broken by the word BREAK. Such sealing and breaking has since been replaced by the idea of vocabularies.

Listing 1: An early version of the FORTH text interpreter (written in ALGOL).

Listing 2: An early version of the FORTH words $\{:\}$ (called DEFINE here) and $\{:\}$ (called END here).

Listing 3: Another prototype of the FORTH text editor, again in ALGOL. In this listing, the word ATOM (the predecessor of the basic unit in FORTH, the word) has been replaced by the word W.

Listing 3 shows another prototype in ALGOL, this time of a FORTH text editor. Here ATOM has become W and I am looking up plus, minus, and the commands T, R, A, and I, to edit a deck program.

Another method of implementing a dictionary is shown in listing 4. I am looking up the words in a conditional statement and setting NEXT, the key routine of modern FORTH's address interpreter, to the index.

Listing 5 shows an early implementation of a stack. Since it is written in BALGOL, which allows assignment statements inside other statements, I could replace STACK[J] with [J+1] in order to push items onto the stack. I did this so that I could manipulate parameters that were interpreted from the card deck as arguments to the routines. When I wanted, for instance, to convert angular measure from one unit to another, this added the ability to use arithmetic operators.

From Stanford I moved to the East Coast, where I programmed on a free-lance basis for several years. Some of you probably remember that, in the 1960s, a programmer at a typical computer center needed to learn about nineteen languages in order to function adequately: JCL (Job Control Language); languages to control utilities and facilities, such as the linking loader; assembly language and the assembler's control language; plus several high-level languages and the methods for controlling their compilers.

Listing 6 shows two of these languages, a PL/I program and the JCL necessary to run it. Note the obvious difference in syntaxes. FORTH developed in response to such conditions. In terms of modern FORTH, the importance of this example lies in the use of NEXT as a procedure that goes off to get the next word and do something with it.

Listing 7 shows a version of FORTH coded for the IBM System/360 with the routines PUSH and POP, which executed in about 15 μ s. They include stack limit checking, which doubled the cost and was one of the things that led me to believe that execution-time stack checking is not desirable. This was coded in a macroassembler that did not have stack operations, which led to the deck full of statements like L19

DC AL2(*-L18), which gave me a link from L19 to the previous label. It worked but it was not pleasant.

Listing 8 shows a similar routine, this time coded in COBOL. I am setting up a table of identified words that will be interpreted from an input stream. Since COBOL does not allow parameters for subroutines, it is awkward to do anything meaningful.

New Concepts

About this time, I began to think of defining a word that would define other words; and at that time, this idea was staggering. For example, { ;CODE } was a very esoteric word. I explained it to people, but I could not express the potential I thought it had.

It took time to find out exactly what { ;CODE } should do (it specified the code to be executed for a previously defined word). I do not have the records, but I think the initial code for { ;CODE } was three or four lines long; to simplify that code was one of the driving forces behind the address interpreter-to make it possible to code { ;CODE } cleanly. This had implications as to what registers should be available.

The fact that W should be saved in a register for defining words led to indirect, rather than direct, threaded code. That was the most complicated concept I had coded in this evolving program-probably deserving of a patent in its own right.

A little bit later, it seemed that there ought to be an analog of {;CODE } that specified the code to be interpreted when you executed a word. It seemed the natural balance, but when the idea first arose, I did not have the foggiest notion of what to do or what the implementation should be. The first definition of this analog, called { ;: } (semicolon-colon), required three or four lines of code. It had to do what { ;CODE } did, and then more.

Out of that came the distinction between compile-time action and

execute-time action. It was convenient for words to be coded to act this way, but it was expensive. It required not only the address of the code to be executed, but the address of the code to be interpreted, as well as the parameter to be supplied to the code being interpreted so you could do something useful.

Late in the 1960s I went to work for Mohasco Industries, where I put something strongly resembling FORTH on a Burroughs 5500, crosscompiled to the 5500 from an IBM 1130. (There is no assembler on the 5500; there is a dialect of ALGOL called SBOL that Burroughs used to compile operating systems, not available to users.) Listing 9 shows the code definitions of stack operations on the 5500, which was a stackoriented processor at a time when stack machines were not popular. The names of some FORTH stack operators stem from that machine's operations; see, for example, DUP . The symbol ¢ stands for CODE and distinguishes the assembler's OR from the FORTH OR . (Vocabularies were not yet available.)

Listing 10 gives an example of FIND (a dictionary search routine) coded for the 5500. Notice the word SCRAMBLE, a colon definition making a hashed search. Apparently I had eight threads to the dictionary here, a

concept we added back to FORTH when we developed polyFORTH last year.

FORTH and the IBM 1130

At Mohasco I also worked directly on an IBM 1130 interfaced with an IBM 2250 graphics display. The 1130 was a very important computer; it had the first cartridge disk, as well as a card reader, a card punch (as backup for the disk), and a console typewriter. The 1130 let the programmer, for the first time, totally control the computer interactively.

FORTH first appeared as an entity on that 1130. It was called F-O-R-T-H, a five-letter abbreviation of FOURTH, standing for fourthgeneration computer language. That was the day, you may remember, of third-generation computers and I was going to leapfrog. But because FORTH ran on the 1130 (which permitted only five-character identifiers), the name was shortened.

What came out of the 1130 was a cross-assembler that assembled the instructions, which were then to be executed by the 2250. I think the 2250 had its own memory, and these things had to be programmed carefully. What I accomplished was that the 1130 in FORTRAN in 32 K bytes could draw pictures on the 2250, fairly slowly; and FORTH, in 8 K bytes, could draw three-dimensional moving pictures on the 2250-but it could do that only if every cycle was accounted for and if the utmost was squeezed out. That is why FORTRAN had to go-I required an assembler and could not do an impressive enough job with FOR-TRAN.

But high-level or colon definitions were not yet compiled—the compiler came much later. The text was stored in the body of the definition, and the text interpreter reinterpreted the text in order to discover what it was to do. This contradicts the efficiency of the language, but I had big words that put up pictures and I did not have to interpret too much. The cleverness was limited to squeezing out extraneous blanks as a compression medium. I am told that this is the way that BASIC acts today in many instances.

This machine had a disk drive, and I am almost certain that the word BLOCK existed in order to access

records off the disk. I do remember that I had to use the FORTRAN I/O (input/output) package and that it would not put the blocks where I wanted them; it put the blocks where *it* wanted them, and I had to pick them up and move them into my buffers.

At Mohasco I also implemented FORTH on a Univac 1108, interfacing it with their COBOL compiler. Listing 11 displays a set of record descriptions in a Dun and Bradstreet reference file (for looking up bad debts). The layout shows named fields followed by the number of bytes allocated.

The Mohasco programs mark the transition point between something that could be called FORTH and something that could not. All the essential features except the compiler were present by 1968.

The First Modern FORTHs

The first modern FORTH was coded in FORTRAN. Shortly thereafter it was recoded in assembler. Much later it was coded in FORTH. It took a long time before I thought that FORTH was complete enough to code itself. The first thing to be added to what had already existed was the return stack. That was an important development; the recognition that there had to be exactly two stacks, no more, no less.

The next thing to be added was even more important—*the fullfledged dictionary*, that is, the dictionary in the form of a linked list. Up until then, flags had been set or computed GO TOs had been executed to provide some mechanism for associating a subroutine with a word. The replacement of all that by a code file containing the address of the routine made an incredibly fast way of implementing a word once it was identified.

The first use of modern FORTH occurred when it was written for a Honeywell H316 at the NRAO (National Radio Astronomy Observatory). In 1971 I was hired by George Conant to write a radio-telescope data-acquisition program: that led to the next step, the compiler. This meant the recognition that, rather than reinterpret a string of text, words could be compiled and an average of 5 characters per word could be replaced by 2 bytes per word. This gave a compression factor Listing 8: A structured table routine, in COBOL.

I/O, however, was not yet interrupt-driven. Interrupts were available for the application if it wanted them—FORTH did not bother.

Interrupts came around this time. It

This computer was a PDP-11; the multiprogrammer had four tasks. Input was still not interrupt-driven, which was unfortunate.

The Second FORTH Programmer

Ten years ago there was one FORTH programmer, me. The second FORTH programmer, Elizabeth Rather, came along in 1971. That is quite a quantum jump, from one to two; the next step was four (the next two came out of Kitt Peak National Observatory); the growth can be traced from there to the several thousand today.

The first FORTH user was Ned

Conklin, head of the NRAO station at Kitt Peak, Arizona. NRAO runs a millimeter-wave radio telescope that is in great demand by observers, in part because it is responsible over the last 10 years for discovering half of the interstellar molecules that are known to exist. FORTH is still running on that telescope at Kitt Peak and on a lot of other telescopes.

Given interest from other astronomers, a few believers split off from NRAO in 1973 and formed FORTH Inc. We were deluged by requests for FORTH systems from astronomers and went into business to try to exploit that market. It would still be our principal line of business today except that there are so few new telescopes in the world that you

cannot support a company on that market.

We developed miniFORTHTM (FORTH on minicomputers) with the idea of having a programming tool. An important implementation of the tool came when we put an LSI-11 and FORTH into a suitcase. I think I became the first computer-aided programmer—computer-aided in that I had my computer and took it around with me. I talked to my computer, my computer talked to your computer, and we could communicate much more efficiently than I could communicate directly with your computer before it could run FORTH. Using this tool, we have put FORTH on many computers.

We added the feature of interruptdriven I/O when FORTH Inc produced its first multiterminal system. It did not speed things up particularly from the user's point of view, but it *did* prevent any loss of characters when several people were typing at the same time. You did not have to look quickly to get the character before the next one came along. They were all buffered and waiting for you, which is an important distinction for multiprogrammed systems.

Data-base management came along at this time. It has been extensively changed, just as FORTH has. But fundamentally, nothing has changed. The concept of files, records, fields, and relational pointers that polyFORTH[™] offers dates back from 1974 or so—years and years ago. Listing 12 shows a recent application of the FORTH Inc data-base management system.

With microFORTHTM in 1976 came the first version of our current target compilers. They are very complex things, much more so than I expected them to be. At about the same time, we worked out the current implementation of DOES> .

This new form of { ;: } does not require the address of the code to be interpreted. Since that is supplied by a different mechanism, the parameter can occupy the parameter field as it is supposed to. You can "tick" it and change its value, which is nice. [The FORTH word { ' } (called "tick" above) places the address of the word that follows it onto the stack....GW] But we save 2 bytes for every DOES> word, 2 bytes for very common words—and for 3 years, we did

not realize that we had missed the optimum by so much.

I know no way of speeding this process from initial thought to development, except to let a certain amount of time pass. We could sit, we did sit and debate this thing endlessly, and we missed the obvious.

I think that completes the capabilities that I think of as FORTH today. You see how they dribbled in-at no point did I sit down to design a programming language. I solved the problems as they arose. When demands for improved performance came along, I would sit and worry and come up with a way of providing improved performance.

polyFORTH is a condensation of everything that we at FORTH Inc have learned in the last 10 years of developing FORTH. I think it is a very good package. I foresee no fundamental changes in the design of the language except for accommodation to FORTH standards, which are becoming increasingly important.

Implementations of FORTH

I would like to review the implementations of FORTH of which I am aware. It is actually a tour through the history of computers and it is fascinating that this could all have happened in 10 years.

FORTH has been programmed in FORTRAN, ALGOL, PL/I, COBOL, assembler, and FORTH; and I am sure some of you can come up with other languages with the same history. My list is strictly personal.

FORTH has been implemented on the Burroughs 5500; the IBM 1130; the Univac 1108; the Honeywell 316; the IBM 360; the Data General Nova; the HP 2100 (not by me but by Paul Scott at Kitt Peak); the PDP-10 and PDP-11 (by Marty Ewing at the California Institute of Technology); the PDP-11 (by FORTH Inc); the Varian 620; the Mod-Comp II; the GA SPC-16; the CDC-6400 (by Kitt Peak); the PDP-8; the IV-Phase; the Computer Automation LSI-4; the RCA 1802; the Honeywell Level 6; the IBM Series 1; the Interdata; the 6800; the 8080; the 8086; the TI-9900; and soon the 68000, the Z8000, the 6809, and a Child Inc computer. Some independent groups have 6502s, ILLIAC, and others running FORTH. I raise the question-is it the case that FORTH has been put on

every computer that exists?

Some people think FORTH ought to be machine independent, but that premise is wrong. The equivalence is FORTH-each machine requires meticulous attention to its individual characteristics. You must use all the hardware capabilities of each machine and must then work to force it into the mold specified by FORTH's virtual machine.

For example, we put a subset of FORTH on an SMS-300 microcomputer. It had only eight instructions. The internal characteristics of every

At no point did I sit down to design a programming language. I solved the problems as they arose.

machine can and must be exploited. You do not need any particular number of registers or stacks or anything. All can be simulated, but if you neglect the abilities of the machine, you can end up a factor of 2 down in performance from where you might otherwise be.

FORTH-in-Hardware Computers

The first FORTH computer I know of was built at Jodrell Bank in England around 1973. It is a redesign of an English Ferranti computer that went out of production. The observatory at Jodrell Bank was going to build their own bit-slice version; they discovered FORTH about the same time, modified the instruction set to accommodate FORTH, and built what I am told is a very fast FORTH computer. I have never seen it, but have talked to its competent designer, John Davies, who is one of the early FORTH enthusiasts.

In 1973, before Dean Sanderson came to FORTH Inc to develop microFORTH, he had a FORTH computer at a company called General Logic. It qualifies as a FORTH computer because it has a FORTH instruction. And there is a story there. Dean showed me his instruction set, and there was this funny instruction that I could not see any reason for-I figured it was some kind of no-op or catchall or something; it had the weirdest properties, and it could not possibly be useful. It was NEXT. It was a oneinstruction NEXT which was beautiful. And it was a very simple modification (this was a bit-slice computer) to the instruction set-a few wires here and there-and that is the first time I saw a FORTH computer, if you will. I call it a FORTH computer because it had the ability to change itself from an ordinary computer into a FORTH computer.

I think that hardware today is in the same shape as software was 20 years ago. No offense, but it is time that the hardware people learned something about software. There is an order or two of magnitude improvement in performance possible with existing technology. We do not need picosecond computers to make really substantial improvements in execution speed. Faced with that realization, there is no point in trying to optimize the software any further until we have taken the first crack at the hardware. The hardware redesign has to be as complete as the software redesign was. The standard microprocessors did not have FORTH in mind. Those minicomputers that can be microprogrammed cannot be microprogrammed well enough to even be worth doing. The improvements available are much greater than you can achieve by these half measures.

I have built a small FORTH computer. The design changes as fast as the chips can be plugged into the board. But it is not difficult to do. Here are the characteristics of a FORTH computer:

- It does not need a lot of memory (16 K bytes is about right-half programmable read-only memory, half user programmable memory, maybe).
- It does not need a lot of I/O ports; in fact, it does not need any I/O ports except for the application requirements.
- A serial line and interface to a disk drive are useful but not required.

We have put FORTH on an 8080-based machine with a virtual disk in memory, enough memory to hold eight blocks. The system is quite viable and has no particular problem with system crashes. Bubble

A printer isn't much good if it can't do the job when it's needed.

That's why, at Diablo, we don't just design printers that work. We design printers that keep on working. In fact, we make them so reliable, you can just open the carton, plug in and play.

Diablo offers the widest range of reliable printers and options to give the flexibility you need. Which stands to reason. After all, we pioneered the daisy wheel technology and we're still the leader in it.

memories are coming. A FORTH computer does not need much mass storage; 100 K bytes are adequate, and 250 K bytes are plenty. The fact that FORTH can exist quite happily on a machine that is very small by contemporary standards should be exploited.

Organizations

Finally, I would like to run through the history of the organizations that have been involved with FORTH. They have formed another thread of the tapestry. It began with Mohasco, of course, followed by NRAO and Kitt Peak National Observatory: then came FORTH Inc.

The next step was probably DECUS (Digital Equipment Computer Users' Group). Marty Ewing gave his PDP-11 FORTH system to DECUS. FORTH Inc was not sure whether free FORTHs floating around was a good idea at the time. But it turned out that a lot of people were exposed to FORTH who otherwise would not have been.

Cybek came along and provided an entry into the business-systems market. Art Gravina, the president of Cybek, is the person who designed

our data-base management system. He provided us the opportunity to do commercial systems and the ability to handle ten times as many terminals as he could with the BASIC program that preceded it.

In about 1976, a committee of the International Astronomical Union met and adopted FORTH as a standard language. That was a boost in the world of astronomy, although the world of astronomy was no longer the major driving force in the popularity of FORTH.

I think EFUG (the European FORTH Users' Group) came along about that time (1976). It turned out to our surprise that Europe was a hotbed of FORTH activity that we were largely unaware of (and perhaps still are, in that we are not involved in that world and do not appreciate the level of interest). An international FORTH Standards Team probably grew from their first meetings. A couple of years later, the FORTH Interest Group started. Now we have FORML-FORTH Modification Laboratory, an idea-generating organization.

Conclusion

The tendency seems to be for people to organize themselves in groups. Some of these groups are companies, others are associations. It looks like FORTH is going to be a communal activity in that sense—that it will grow from the work of unstructured clusterings of like-minded people. The suggestion is that this whole world of FORTH is going to be quite disorganized, uncentralized, and uncontrollable. It's not bad, perhaps it's good.

My view of the future is more unsettled today than it has been for years: promising, confusing, perplexing. The implications are perhaps as staggering now as they were 20 years ago. The promise of realization is much higher. My original goal was to write more than forty programs in my life. I think I have increased my throughput by a factor of 10. I do not think that that throughput is program-language limited any longer. So I have accomplished what I set out to do: I have a tool that is very effective in my hands. It seems it is very effective in others' hands as well. I am happy and proud that this is true.

NordPro Solve Your Paperwork Problem Let WordPro Software Do The Work

Using standard typing methods, hundreds of valuable hours are spent erasing, revising, and retyping letters and documents as you work towards a final draft copy. The second, third, or fourth drafts take just as long to type as the first!

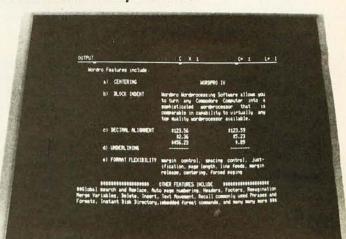

With WordPro word processing software you can transform your Commodore computer into a "state of the art" word processing machine with sophisticated word processing features at an affordable price.

There are four versions of WordPro, ranging from the simple to the sophisticated. WordPro 1 on cassette will give computer enthusiasts a full range of text editing capabilities with cassette file storage. WordPro 2 is disk based and allows fast and easy file handling and manipulation. WordPro 3 was designed for professionals and contains the many features required in a business environment such as global search and replace, headers, footers, decimal tabulation, repagination, merging capabilities, and much, much more. WordPro 4 is our best. WordPro 4 runs on the new Commodore 8032, 80-column display computer. WordPro 4 has all the features of WordPro 3, plus additional features usually found only on the most sophisticated and expensive word processing equipment.

WordPro is a new breed of word processing software. Powerful, sophisticated, and easy to use, WordPro was field-tested by dozens of attorneys and commercial customers during 1979. WordPro is now installed and is saving its owners valuable time and money in hundreds of offices nationwide.

WordPro was designed with the user in mind. WordPro's unique "STATUS LINE" constantly interacts with the user by displaying the status of the system. Editing, storing documents, recalling letters, even the most sophisticated comands, are accomplished by a few, easy to remember, keystrokes.

You may find that WordPro alone is reason enough to own a computer. WordPro can be found at most Commodore dealers worldwide. Call us for the number of the dealer nearest you. If you cannot locate a stocking WordPro dealer you may place an order with Professional Software via check or VISA/MasterCharge.

Components of FORTH

FORTH is characterized by five major elements: dictionary, stack, interpreters, assembler, and virtual memory. Although not one of these is unique to FORTH, their interaction in FORTH produces a synergistic effect that creates a programming system of unexpected power and flexibility.

- Dictionary: The resident FORTH system is organized into a dictionary that occupies almost all of program memory. The dictionary is a threaded list of variable-length items, each of which defines a word of the vocabulary. The actual content of each definition depends on the type of word: noun, verb, etc. The dictionary is extensible, growing toward high memory. In a multiterminal system, terminal tasks may have private dictionaries that are connected in a hierarchical tree structure.
- Stack: Two push-down stacks (last-in, first-out, or LIFO, lists) are maintained for each multiprogrammed task in the system. These provide the primary communication between routines as well as an efficient mechanism for controlling logical flow. A stack normally contains items one computer word long, which may be addresses, numbers, or other objects. Stacks, which are of indefinite size, grow toward low memory.
- Interpreters: FORTH is fundamentally an interpretive system, meaning that program execution is controlled by data items rather than by machine code. It is a common assumption that interpreters are severely wasteful of processor time; this is avoided in FORTH by maintaining two levels of interpretation.

The first of these is the text interpreter, also known as the outer interpreter. It works in a conventional manner, parsing text strings that come from terminals or mass storage and looking up each word in the dictionary. When a word is found in the dictionary, it is executed (unless the task is in compile mode) by invoking the address interpreter.

The address interpreter (also known as the inner interpreter) interprets strings of absolute memory addresses by executing the definition pointed to by each. Most dictionary definitions contain addresses of previously defined words that are to be executed by this interpreter. This level of interpretation requires no dictionary search since these words have already been compiled by the text interpreter, which generated the absolute addresses.

The address interpreter has several important properties. First, it is fast. Indeed, on some computers it executes only one instruction for each word, in addition to the code implied by the word itself. Second, it interprets compact definitions. Each word referenced in a definition compiles a single memory location. Finally, the definitions are machine independent because the definition of one word in terms of others does not depend upon the computer that interprets the definitions.

- Assembler: FORTH includes a resident assembler, which allows the programmer to define words that will cause specified machine instructions to be executed. This type of definition is necessary to perform device-dependent input and output operations, to implement elementary operations, and to do highly timecritical processing.
- Virtual memory: The final key element of FORTH is its blocks: fixed-length segments of disk space that may contain program text or data. A number of buffers are provided in memory; blocks are read into them automatically when referenced. If a block is modified in memory, it is automatically replaced on disk. Explicit read and write operations, therefore, are not required; programmers may presume that program text or data is in memory whenever it is referenced.

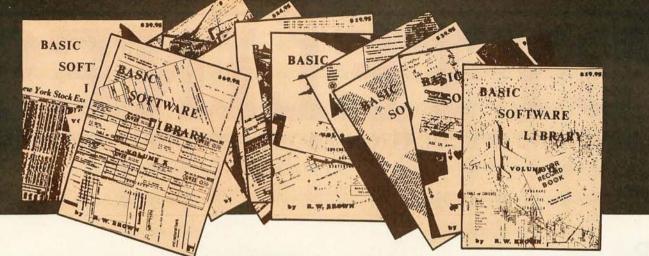

[The above paragraphs present a concise overview of FORTH as a language; the following paragraphs describe features of a FORTH Inc product, polyFORTH...GW]

The standard polyFORTH system utilities include the following:

Text editor:	Facilitates editing program source text, both by line and by character.
Source listings:	Prints program source listings and indexes.
Disk copy:	Provides for disk-to-disk copying of data file and program source files for backup purposes.
Disk diagnostic:	Produces a simple, read-only disk diagnostic that may be run at any time without disturbing other users. (More extensive hardware diagnostics are optional.)

Each polyFORTH system also contains a Target CompilerTM capability; this allows the user to develop, for run-time applications only, a computer system that does not require the entire operating system. Since FORTH is an interpretive language, an interpreter must always be present; but the target compilation process creates the minimum dictionary necessary, thus allowing a program to be run with a minimum of memory overhead. Typically, this overhead is less than 1000 bytes.

Full data-base management support is available in an optional Extended File Management package. Included within its structure are the essential features of the CODASYL standard along with the characteristic speed, compactness, and flexibility of the FORTH language. Facilities include commands for file definition and formatting and for field and record descriptions, as well as several file-accessing techniques, operators for accessing individual fields by name and fields within specified files, and such utility functions as a report generator and an optional key-sort routine.

BYTELINABOUT PERSONAL COMPUTING

Conducted by Sol Libes

Personal Computer Prices Increasing: Both Texas Instruments (TI) and Atari recently announced price increases for their personal computer systems. Radio Shack, Commodore, and Apple are holding the line, at least for the present.

Atari increased the price of its Model 400 from \$550 to \$630 and the Model 800 from \$1000 to \$1080. The company attributed the increase to rising component costs, particularly components that incorporate precious metals.

TI, on the other hand, has subtly unbundled the 99/4 system. Previously, a purchaser bought the keyboard/processor console and a 13-inch color video monitor for \$1150. Now he can buy the console for \$950 and the monitor for \$450, a total of \$1400. Or, he can buy the console and an RF (radio-frequency) modulator (\$75) and hook it up to a standard color television set. This combination costs \$1025, which is only \$125 less than the old complete system price.

Although Radio Shack, Commodore, and Apple have not raised the prices of their basic systems, certain peripheral devices and add-ons have increased in price. Furthermore, when the Federal Communications Commission (FCC) RF-radiation standards go into effect on January 1, 1981, there may be significant price increases.

Most personal-computer marketing experts agree that for personal computing to become a true mass market, prices must decrease, not increase. The experts are therefore disturbed over what they feel will be a real damper to personal-computing sales.

Software Piracy: Over the years, software vendors have complained many times about hobbyists copying software from one another instead of buying it. One supplier even has gone so far as to offer a \$10,000 reward for information leading to the conviction of anyone found copying its software. I am not aware that this plan has had any positive results. It has, however, raised the ire of many hobbyists, and there may have been a negative effect on this particular supplier's software sales, because he sells cassette software mostly to hobbyists.

Although copying by hobbyists remains a problem for software vendors, a much greater problem has developed: software piracy for commercial purposes, by pirate vendors who are marketing copies in much the same way as audio- and videocassette pirates do.

For example, Nestar Systems of Palo Alto, California, has charged that its read-only-memorybased "Basic Programmer's Toolkit" (for the Commodore PET) is being distributed in Europe in both cassette and floppydisk format. The pirating distributor is alleged to have changed the code (relocating it into user memory) and to have changed the copyright notice. Nestar is taking action in this case.

This type of software piracy will have a more serious financial impact on the software vendor than hobbyist copying. Here, the vendor is actually losing dealer sales, since many dealers are purchasing the software from the pirate at a much lower cost-and probably marking it up more—than if the dealer purchased it from the legitimate vendor. In most instances, end users are not aware that they have purchased a pirated copy until they try to get software support from the rightful vendor.

Intel Releases Data on 32-Bit Microprocessor:

Intel, the recognized leader in microprocessor development, has "leaked" advanced information on three new forthcoming 16- and 32-bit microprocessors. Intel is now playing the game of trying to scoop its competition by announcing products long before they will be available in production. This will, no doubt, have an impact on sales of the Zilog Z8000 and Motorola MC68000, as purchasers may now wait for a more powerful product.

The 32-bit microprocessor will be known as the iAPX-432, and will be a 3-chip set with a brand-new architecture and instruction set. Intel claims that it will provide the power of a medium-scale IBM 370 system. It will directly execute Ada code. Ada is an upward extension of Pascal, and it is the language designed for and to be used by the US Department of Defense. It is interesting to note that at this time there is no Ada compiler up and running.

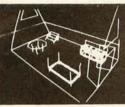

The two new 16-bit microprocessors are essentially 8086s with integrated functions and higher speed to improve performance. They are intended for multiprogram and multiuser systems.

Intel promises that all three new microprocessors will be available in 1981, with the 32-bit microprocessor becoming available first.

3-D ANIMATED COLOR GRAPHICS

Exciting

The Program made famous on National TV!

FOR 48K APPLE II COMPUTERS WITH DISK

APPLE WORLD turns your Apple into a sophisticated graphics system capable of creating animated three-dimensional color images, projecting them in true perspective on the screen, rotate them, move them closer, further away, and many other exciting and imaginative things.

A powerful screen-oriented text editor is included to facilitate image formation. This program was recently featured on Tom Snyder's Prime Time Saturday TV Show and is now available for sale

APPLE WORLD'S powerful editor is so easy to use that children will love it. You can now "sketch" your dream house, boat, car, or fantasy empire. Then view it as it would be seen from 10,000 feet, or you can ZOOM in until the screen is filled with a doorknob. You could then go inside and move from room to room examining furniture placement as your screen rotates within the room. Images or specific parts of images can easily be saved to disk or printer.

Does all this sound like science fiction? You won't think so after you have visited Apple World.

KRAM By Ken Germann RANDOM ACCESS METHOD

Many times more powerful and efficient than the primative "relative

KRAM is the FASTEST and MOST POWERFUL keyed access method available for the Apple & Commodore CBM (Pet) Computers. Written entirely in 6502 machine code, KRAM is extremely fast, comprehensive in scope, very compact, and easy to use. KRAM function calls are invoked via a single instruction.

Using the sophisticated capabilities of KRAM the Apple& CBM (Pet) can now fully meet the requirements of information management applications, such as: Accounts Receivable/Payable, Inventory Control, General Ledger, Payroll, Mailing lists, and Database Management. Programs can now be 30% to 90% shorter and run many times faster! Less experienced users can now create powerful programs!

KRAM Release 2.0 Functions:

- Create/Open a dataset
- · Put record by Key
- · Add & delete records by Key · Get any record by Full/Partial key in 4/10ths of a second (2/10ths with Corvus Disk)
- · Supports multiple disks
- · Read next or previous record
- · Dynamic space allocation
- · Dynamic space reclamation Dynamic index compression Never needs file
 - reorganization!

An 87 page manual fully documents KRAM 2.0 detailing KRAM functions and illustrating with programming samples. KRAM architecture is fully explained and a sample mailing list application program is included.

PET & Apple Requirements

KRAM is designed to work with both Apple's Disk II, or Corvus Systems 10 Megabyte Winchester Disk, and Commodores 2040, 3040, and 8050 Disk units. KRAM 2.0 requires an integer Apple or Apple Plus with integer card and at least one disk drive. KRAM works on any 40/80 column 16K/32K PET.

5¹/₄-Inch Mini-Winchester Disk Introduc-

ed: Shugart Technology of Scotts Valley, California (not to be confused with Shugart Associates) has introduced a 51/4-inch Winchester-type hard-disk drive with a 6.38-megabyte unformatted capacity. It is the same size and uses the same power-supply voltages as a standard 5¼-inch floppy-disk drive. [See Tom Manuel's article, "The Hard Disk Explosion," on page 58 of this issue for more details....CM]

Lobo Drives, Goleta, California, plans to make available a low-cost controller which interfaces the 5¼-inch hard-disk drive and floppy-disk drives to several personal-computer systems. These products should become available in 1981.

Random News Bits:

Votrax (Division of Federal Screw Works, 500 Stephenson Hwy, Troy MI 48084) has announced a new voice synthesizer with an unlimited vocabulary in seven languages and controllable inflection. The Model VSB, built on a single printed-circuit card, is intended to interface with terminals, electronic typewriters, word processors, and other equipment. The unit is controlled by 8-bit input commands that select phonemes and inflection. Original equipment manufacturer price is \$280....A national FORTH language group is in operation. They publish a newsletter, distribute software, and conduct meetings. For information contact: Jim Flounoy, 17370 Hawkins Ln, Morgan Hill CA 95037....Radio Shack has released a software package for its TRS-80 Model I which enables users to originate Mailgram messages. Users must have a Western Union (WU) Electronic Mail account, and if so, users are billed monthly by WU for messages sent....Matsushita Electric, Osaka, Japan, has introduced a singlecomponent voice synthesizer that generates either 10 seconds of highquality speech or up to 30 seconds of low-quality speech. The integrated circuit uses only 28 pins and operates from +5 V. The device will probably be used in consumer appliances, cars, etc....National Semiconductor, Santa Clara, California, has introduced a microprocessor that includes a read-onlymemory-resident BASIC interpreter and 64 bytes of user memory. The singlechip computer keeps getting closer and closer to reality....CompuServe, the company that provides the MicroNet information utility, has been negotiating with H & R Block about a corporate merger, with intent to become a subsidiary of the income-tax firm.

Random Rumors: A

semiconductor manufacturer will soon introduce two integrated circuits that together will handle all interfacing requirements for the S-100 bus, thereby reducing the number of components required by S-100 master and slave boards. The two devices will provide all the necessary bus buffering, control signals, and address decoding and will meet IEEE S-100 specifications....Hewlett-Packard (HP) is rumored to be working on a hand-held calculator that is programmable in BASIC (maybe they should call it a computer). Rumor is that they, and several others, will introduce such units by year end. A few have already been introduced in Japan....Texas Instruments (TI), which has been working on a disk-drive system of its own, is now negotiating with a number of outside suppliers for 8-inch Winchester-type hard-disk drives to be included in a new smallbusiness/word-processor system to be introduced next year. TI, however, is still pursuing in-house designs. TI is also negotiating with several tape-drive suppliers for a backup storage system....The rumor is that Tandon Magnetics, Chatsworth, California, is about to announce a 2-megabyte guad-density 5-inch floppy-disk drive with a \$375 original equipment manufacturer price tag....Look for Integral Data Systems to introduce a \$1500 letter-guality dotmatrix printer. It will use overlapping dot-matrix printing. To be called "Paper Tiger Plus," it will

print at 120 cps, with proof copies at over 200 cps.

Too Good To Be True? A rumor recently heard at BYTE says that a major manufacturer will shortly introduce a 5-inch floppydisk drive with a tenfold increase in density. This sounds too good to be true. Will standard media support such an extension?...CH

Microminis and Micromaxis: Two new

words have been coined to describe the newer microprocessors. If an 8-bit processor is called a "micro," then a 16-bit

microprocessor must be a "micromini." That is the conclusion of many in the industry, particularly since many of these new 16-bit microminis will be competing head-on with applications that were previously the exclusive domain of the 16-bit minicomputers.

It therefore follows that the 32-bit microprocessors, which are expected within three years, should be called "micromaxis," since they will most likely compete for applications previously handled by large mainframe computers. At least that is what many industry watchers think.

Well now...my question is: what do we call a 4-bit microprocessor? Is it a "minimicro"?

MAIL: I receive a large number of letters each month as a result of this column. If you wish a response, please include a stamped, self-addressed envelope.

MICROSOFT. NOBODY DOES IT BETTER.

In 1975, Microsoft wrote the first BASIC interpreter for the 8080. Today, hundreds of thousands of microcomputers run with Microsoft software. And tomorrow—a full line of system software for the 8086 and 28000. With microcomputer software, nobody does it better.

BASIC Compiler Microsoft's BASIC compiler is the ideal software tool for the development of BASIC applications programs for resale. Compiled object code for any application may be distributed to your customers on diskette or ROM, thus safeguarding the source program. And execution speeds with our compiled BASIC code are faster than with any other BASIC. Highly optimized, compact object code means maximum efficiency in any application. The BASIC Compiler supports all the language features of our BASIC-80 Interpreter. Comes with macro assembler and loader. Runs with CP/M, ISIS-II, TRSDOS. \$395.

BASIC Interpreters for 8080, Z80, 8086, 6800, 6809 Language

features above and beyond any other BASIC have made Microsoft's BASIC the world's most popular interpreter. And now three new versions are available for the 8086, 6800, and 6809. The latest releases of BASIC-80 and BASIC-86 support the new WHILE conditional, plus CHAINing of programs with COMMON variables, dynamic string space allocation and variable length records in random files. All versions have double precision arithmetic, full PRINT USING, tracing, renumbering, edit mode, and many other features. BASIC-80 for CP/M, ISIS-II, TEKDOS: \$350. BASIC-86 standalone on SBC 86/12: \$600. BASIC-68 for FLEX: \$200. BASIC-69 for FLEX: \$250.

COBOL-80 Compiler The best implementation of the world's most widely used programming language is COBOL-80 from Microsoft. As small business applications become not-so-small, COBOL-80 is ready with powerful use of disk files, data manipulation facilities, CHAIN, segmentation and interactive ACCEPT/DISPLAY. Plus threedimensional arrays, full COPY facility, indexed and relative files and an optional packed decimal format that saves on mass storage by as much as 40%. Comes with macro assembler and loader. Runs on CP/M, ISIS-II, and TRSDOS. \$750.

NEW! muSIMP/muMATH-79

At last, a sophisticated math package for microcomputers, muMATH performs mathematical operations efficiently and accurately. Use it to solve equations and simplify formulas: or perform exact arithmetic, symbolic integration and differentiation, infinite precision integer arithmetic and symbolic matrix inversion. muMATH is an invaluable tool for engineering and scientific applications involving lengthy, analytical computations. It is also an ingenious teaching method for all levels of math from arithmetic to calculus. muMATH is implemented in mu-SIMP, a highly structured language for complex symbolic manipulations. muSIMP/ muMATH Package, CP/Mversions: \$250.

NEW! muLISP-79 LISP—the lingua franca of the artificial intelligence world—is now available in this efficient, lowcost version for microcomputers. Features include dynamic allocation of storage resources; program control structures such as an extended COND and a multiple exit LOOP; user functions defined as CALL by Value or CALL by Name; and 83 LISP functions. muLISP-79, CP/M version: \$200.

NEW! XMACRO-86 For the development of 8086 programs, our new XMACRO-86 cross assembler has just been released, It supports the same features as our MACRO-80 assembler. Develop 8086 programs now on your current CP/M, ISIS-II, or TEKDOS system. \$300.

NEW! Micro-SEED DBMS If you are developing applications software inhouse or bundling hardware and software for resale, a database manager could be the software tool you've been looking for. Micro-SEED is the first CODASYL compatible database management system to run with CP/M; and Microsoft's FORTRAN-80 has been implemented as the host language. When an application becomes limited by traditional floppy disk file handling, but remains overpowered by the cost and maintenance of a minicomputer, the solution is Micro-SEED. \$900.

FORTRAN-80 Compiler Microsoft FORTRAN-80 is the most complete microcomputer FORTRAN available. It has all of ANSI-66 FORTRAN (except COMPLEX data), plus unique enhancements for use in the microcomputer environment. An extensive library of single and double precision scientific functions, too. Comes with macro assembler and loader. Versions for CP/M, ISIS-II, TEKDOS. \$500.

MACRO-80 Assembler The most powerful microcomputer assembler on the market today is Microsoft's MACRO-80. It is fast, and it supports Intel-standard macros, relocation pseudo-ops, conditionals and listing controls. MACRO-80 comes with a relocatable linking loader and runs with CP/M, ISIS-II, and TEKDOS. \$200.

EDIT-80 Text Editor Random access to floppy disk files makes EDIT-80 the fastest microcomputer text editor. It's the essential tool for creating and maintaining all files. EDIT-80 includes FILCOM, a file compare utility. EDIT-80, CP/M version: \$120. Prices quoted are USA domestic only. OEMs should contact Microsoft for prices.

This selected list of FORTH vendors is meant to be an overview only. For complete details contact the vendors. Many of the products, listed as fig-FORTH versions, are implementations of the FORTH Interest Group software customized for a given machine and available in machine-readable (as opposed to printed) form.

When purchasing a version of FORTH, check to see what source the version is based upon. All good versions of FORTH are based on either the FORTH Inc or the FORTH Interest Group versions. Some existing implementations use nonstandard shortcuts that limit the usability of the product; these should be avoided.

Literature on FORTH is scarce, so be prepared to puzzle through cryptic documentation. Miller Microcomputer Services offers a wide selection of books on FORTH (the only selection we know of). Particularly suitable are microFORTH Primer (supplied with the purchase of MMSFORTH) and Using FORTH, both written by FORTH Inc.

What Is FORTH? A Tutorial Introduction

John S James POB 348 Berkeley CA 94701

FORTH is a programming language with a small but fastgrowing and enthusiastic user community. Though easy to learn at a terminal, it is difficult to explain abstractly because it is so different from other languages. Even advocates do not agree why it is good or how it should be used.

FORTH was developed for control applications (using a computer to run other machinery), data bases, and general business. It is least useful for big number-crunching jobs (eg: writing a matrix inversion routine), although it can link to subroutine packages written in other languages to incorporate such functions. Unlike Pascal, FORTH gives the user complete access to the machine and does not try to guard the programmer against mistakes. But its modularity and other forms of error control allow production of remarkably bugfree application programs-perhaps

Acknowledgments and Availability

Listings 1 thru 7 were run on a FORTH system for the Apple II provided by Cap'n Software, POB 575, San Francisco CA 94101. The PDP-11 examples were run on a system written and distributed by the author. The 8080 example was provided by John Cassady of the Forth Interest Group, POB 1105, San Carlos CA 94070; a similar 8080 FORTH system is available from Forthright Enterprises, POB 50911, Palo Alto CA 94303. Other members of the Forth Interest Group contributed helpful suggestions. And of course we are indebted to the inventor of FORTH, Charles Moore of FORTH Inc, 2309 Pacific Coast Hwy, Hermosa Beach CA 90254, who started it all. more than any other language in common use. The compiler uses much less memory than Pascal does, and its programs run about equally fast. FORTH is much more interactive than most conventional implementations of Pascal. FORTH is available on most common personal computers (eg: Apple, TRS-80) and all major microprocessors (eg: 8080, 6800, 6809, 6502, PACE, LSI-11, and 9900). An international FORTH Standards Team exists, and standard systems are virtually identical among all different machines.

This article will describe what it is like to program in FORTH. A group of annotated terminal sessions, shown in listings 1 thru 10, will provide more details on the language itself.

The Philosophy of FORTH

FORTH reduces the cost of a subroutine to very little, and the whole language is built on functions that are like subroutine calls. The programmer keeps defining new words (new functions) from old ones until, finally, one of them is the whole job. Most programmers keep each definition short, usually one to three lines not counting comments. The definitions are compiled as entered and are immediately ready to run.

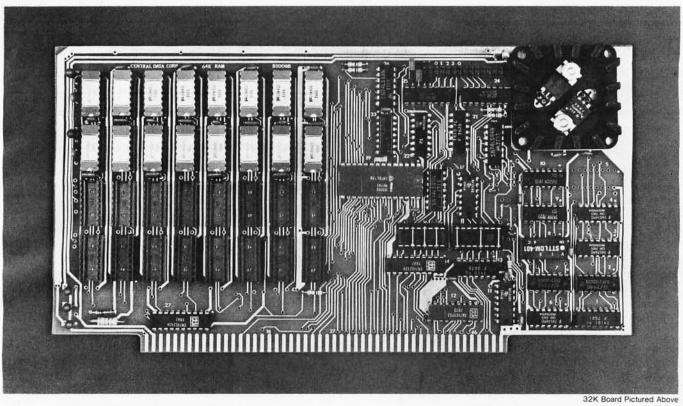

Because FORTH definitions are short, all possible execution paths of the definition can be tested easily. Since most functions work exactly the same when executed as commands from the terminal or when used as components in further definitions, they can be tested immediately from the terminal. And the functions are so general that there is no sharp distinction between program and data.

Since programmers define their own operations, special application libraries of FORTH words can be developed. The new routines are integrally part of the language, so they do not need any special calling sequences, and they are immediately ready to run. Even the original words supplied with the system (there are about one hundred of them), can be redefined if desired, adapting the language for special circumstances. Also, programmers can create their own data types or operation types (eg: their own kinds of arrays or other data structures, or new classes of operations). This flexibility allows unprecedented "customization" of a language to the requirements of a particular installation or application. The finished programs are easily modifiable when requirements change because they are composed of pretested building blocks specially designed for that kind of program.

Stack and Postfix Notation

A smaller convenience of FORTH is that you do not have to do much coding when you start a new program. As soon as the system comes up, all your previous work is ready to go, just as if it were originally part of the language.

A feature that some people do not like is FORTH's use of a stack (explained below) and its *postfix notation* (also called *reverse Polish*

We have now been shipping our 2MHz dynamic RAM boards for over two years. Hundreds of 4MHz boards have been going out every month since early 1979. Our reliability is proven in the thousands of systems which contain our board. Many qualityminded systems houses across the country and overseas are using our boards for their equipment.

Our prices still beat all. Despite rising 16K memory chip prices (at least from reputable suppliers), Central Data continues to give you the best buy in memory today. Nobody offers a board with a capacity of 64K, assembled, tested, and guaranteed for a full year at the price we do. Deselect around PROMs. Our boards have the important deselect feature which lets you overlap any fixed memory in your system with no interference.

Our features make the board easily used and expanded. You address our boards on 16K boundaries with mini-jumps (small shorting plugs that slide over wirewrap pins) near the top of the board for easy access. If you want to expand your board after you have purchased it, all that you need to do is add memory. We can supply you with expansion packages (\$150-2MHz, \$160-4MHz) which include eight RAMs that you can depend on as well as two mini-jumps for addressing. And of course, our board never generates wait states.

Low power consumption keeps your computer running cool and reliable. The total power consumption of our 16K board is typically less than 4 watts (+8V @ 300ma, +16V @ 150ma and -16V @ 20ma). Boards with additional memory typically increase power consumption only 1 watt per 16K!

Standard S-100 Interface. Our board is designed to interface with any standard S-100 CPU. All of the timing of the board is independent of the processor chip, and the board is set up for different processors by changing two plugs on the board.

Call or write us today. That will guarantee a fast response with more information on the board. Or make an order — you'll probably have the board in two weeks! If you're interested, also ask for a catalog on our Z8000 16-bit processor board designed for the MULTIBUS. All of these products are available to your local dealer, also.

notation or RPN). In postfix notation (a system used on most Hewlett-Packard calculators), arithmetic formulas are written with the operations after their arguments, not between them. For example, "2+3" becomes { 2 3 + } in FORTH or other postfix systems; "(4+5)*(6+7)" becomes { 4 5 + 6 7 + * }. (See explanation below.) No parentheses are needed in postfix.

Some programmers do not like postfix, and they ask, "Why doesn't someone write an algebraic-to-postfix translator for FORTH? That would be easy to do." The reason is that postfix has benefits far more important than the compiler-writer's convenience. It greatly simplifies linkage to subroutines. With postfix, you do not need any CALL statement or argument list, or any formal parameters in the subroutine. While arithmeticformula operations (add, subtract, etc) must take either one or two arguments and return exactly one result, postfix functions can have any number of arguments or results.

In FORTH, most operations communicate only through a stack. The stack, perhaps the most important data structure in programming, is used in almost all languages, but most languages hide it from the user. In FORTH, the user controls the stack directly.

A stack is a pile of numbers where the last ones put in are the first ones taken out; that is, you can only remove the number that is on top of the stack. It is like a stack of trays in a restaurant; trays are conveniently added and removed only at the top. (Unfortunately, computer-science texts do not agree on terminology, and a few call the top of the stack "the bottom.")

To see how a stack works in computation, consider the expression $\{23 + \}$ above. In FORTH, numbers are compiled as operations which place their values onto the stack. So when the 2 is executed, it is placed on top of the stack, which then looks as follows: **Figure 1:** Evaluation of the postfix-notation expression, $\{45+67+*\}$. Numbers are pushed onto the stack at the top. Operators (here, + and *) pop the top two entries off the stack and push the result of that operation back on the stack. For example, the first plus sign (column 4) replaces the 4 and 5 on the stack with 9, the result of the addition operation.

2

where the dashes represent whatever data may have been on the stack before. Then after the 3 has been encountered, the stack becomes:

3 2

-

Then the + is executed. The 1-character word + takes two arguments from the stack (destroying them), performs the addition, and leaves the result on the stack. So the stack finally is:

5

_

The reader can verify that when the formula $\{45+67+*\}$ is executed, the stack goes through the sequence shown in figure 1.

Now we can see why FORTH is not the best language for big numbercrunching jobs. Numbers to be operated on must be moved to the stack in addition to whatever operations are to be carried out, and this extra movement slows FORTH down for this kind of computation. Once on the stack, however, arithmetic is fast (for example, single instruction execution for addition on some 16-bit machines, more for 8-bit machines). Also, FORTH can link the useful instructions of one routine and those of another in as little as one or two instruction executions (depending on machine architecture). This makes FORTH programs much faster than BASIC, usually ten times faster or more (assuming an interactive BASIC, that is-FORTH is always interactive). But a good FORTRAN

compiler's code may do numbercrunching several times faster still.

Characteristics of FORTH Code

FORTH is a structured language (as is Pascal) in that it has no GOTO or statement labels in the language. Discussion of structured programming is outside the scope of this article, but its importance for program correctness and maintainability is recognized.

FORTH object code (ie: a compiled program) is extremely compact, even more so than machine language. The reason is that no matter how much work an operation performs, each invocation of it takes the same space in the object program-two bytes. The bigger the program, the greater the memory advantage, since the hierarchical structure of programs allows increasingly powerful and application-targeted operations to be built up. But FORTH has a relatively large run-time memory overhead, so small programs can take less total space in other languages.

[The reason that a FORTH call can be shorter than a normal machinelanguage subroutine call (usually three bytes) is that a FORTH program is interpreted by a FORTH interpreter (also part of the FORTH language) in much the same way that a BASIC program is interpreted by a BASIC interpreter. The "relatively large runtime memory overhead" mentioned above is the FORTH interpreter plus a core of FORTH words defined in machine language. When a FORTH program is very large, it saves enough memory in FORTH calls to make up for run-time memory overhead.... GW/

The complete FORTH system (itself largely written in FORTH) takes about 7 K bytes, and this whole system including the compiler is com-

monly left in memory as a run-time package. Therefore, 16 K bytes and a floppy disk for storing source programs are sufficient hardware for an excellent FORTH system (compare this with the memory requirements of Pascal, 48 K bytes or more). When compactness is especially important, as when programs are burned into read-only memory and embedded in machinery, FORTH's compiler, terminal handler, and operation names-anything not needed to run-can be stripped out of the application program, leaving a runtime package of about 800 bytes, instead of the usual 7 K bytes.

FORTH programming is *reentrant*; this means that different users can share the same copy of a program in memory while running at the same time. FORTH easily handles multitasking, including multiple terminals used for program development. (At present, however, most of the low-cost systems on the market are still single-user.) FORTH is *recursive*, meaning that routines can invoke themselves.

Suppose you want to link your high-level-language program to a machine-language subroutine (eg:

We know you hardcore bit hackers will recognize the computing power derived from combining the FORTH language with the 6809, today's most advanced 8 bit microprocessor.

And we know you'll understand this machine's 16 bit math, indirect addressing and two stacks are ideally suited for implementing FORTH.

But...should anyone need further convincing that FORTH provides a new dimension in power, speed and ease of operation, consider the following:

- It's a modern, modular, structuredprogramming high-level compiled language.
- It's a combined interpreter, compiler, and operating system.
- It permits assembler code level control of machine, runs near speed of assembler code, and uses less memory space than assembler code.
- It increases programmer productivity and reduces memory hardware requirements.
- Call or write today.

 It replaces subroutines by individual words and related groups of words called Vocabularies. These are quickly modified and tested by editing 1024-character text blocks, called screens, using built-in editor.

Many languages make this linkage difficult or impossible. In FORTH, however, it is very convenient. You can type in or load from disk a machine-language routine, using a FORTH assembler, and the new routine can be executed immediately. Listing 9 shows examples for PDP-11 and for 8080.

The word CODE invokes the FORTH assembler and begins the definition of a machine-language routine. Mnemonic instructions and address-mode symbols are understood by this assembler, and the whole power of FORTH is available for address arithmetic at assembly time. FORTH assemblers use postfix notation, so op codes come *after* their addresses, not before as in conventional assemblers.

The machine-language code is generated as the definition is being entered. The completed operation works just like any other FORTH word, so the user does not need to use any special calling sequence, or even need to know which operations are defined in code and which are not. (In fact, about fifty FORTH words are written in machine language—all other words in FORTH are ultimately defined in terms of these fifty words.)

The FORTH assembler allows structured conditionals and loops at the machine-code level; it can also assemble unstructured code if desired. Users can define their own macro-instructions, use custom-made data types, etc.

In other words, the FORTH assembler allows structured programming even in machine code, and it links the resulting machine-language subroutines into the system immediately. No separate assembly and linking-loader passes are needed, and the associated file management overhead is avoided.

Some More Advantages

FORTH programs are highly transportable between different computers. Any assembly-language routines used by the program must be rewritten, but most applications do not need any assembly, and very few need more than a handful of short, critical routines. When FORTH systems have been designed for compatibility, large applications can be moved among very different

For example, it can be practical to down-load program development from a PDP-11 to a TRS-80 or an Apple II. It is even possible to write the software for a product before a hardware commitment is final.

Another advantage is that FORTH is a self-contained operating system. The 7 K bytes include terminal and disk handlers and a rudimentary file system. No other software is needed anywhere in the computer. Yet, if a monitor in read-only memory is available, FORTH can use it; and FORTH can run as a task under some other operating system (eg: CP/M) when that is wanted. FORTH can link together otherwise incompatible pieces of systems: software in readonly memory, operating systems, subroutine packages, and hardware. It provides a user interface that enables subroutine packages normally used by batch (ie: noninteractive) programs, mostly on older, larger computers, to be used interactively.

FORTH puts you in charge of your computer. You can understand everything happening in your software or in any desired parts of it, and you can change it. This means no more "black box" systems that only the manufacturer's specialists can understand, no more dependence on someone else for upgrades, fixes, or documentation, and no more question of who is responsible if software does not work. The whole system is written in FORTH, right down to the bits—your application programs, the compiler, the operating system, the I/O drivers, etc. You do not have to learn some other language or be a systems specialist to modify it.

Disadvantages

Few FORTH systems used today have floating-point arithmetic. This is not a fault of the language; rather, it reflects its history in microcomputer control applications, where integer arithmetic is often needed for speed. Now there is more pressure for floating point, and it is becoming available.

A more fundamental limitation of FORTH is that it is not a typed language (unlike Pascal). For example, if an integer operation is per-

RCA VP-600 series ASCII keyboards are available in two formats. You can choose either a 58-key typewriter format. Or a 74-key version which includes an additional 16-key calculator-type keypad. Both can be ordered with parallel or serial output.

These keyboards feature modern flexible membrane key switches with contact life rated at greater than 5 million operations. Plus two key rollover circuitry. A finger positioning overlay combined with light positive activation key pressure gives good operator "feel," and an onboard tone generator gives aural key press feedback.

The unitized keyboard surface is spillproof and dustproof. This plus high noise immunity CMOS circuitry makes these boards particularly suited for use in hostile environments.

Parallel output keyboards have 7-bit buffered, TTL compatible output. Serial output keyboards have RS 232C compatible, 20 mA current loop and TTL compatible asynchronous outputs with 6 selectable baud rates. All operate from 5 V DC, excluding implementation of RS 232C.

Or call our toll-free number: 800-233-0094. formed on a floating-point quantity, no message is printed either at compile time or at run time to warn of this error. (However, the user *can* add type checking and other errorpreventing operations into any FORTH word.)

It may seem that unreliable code would result from the untyped nature of FORTH, but, in fact, FORTH code is remarkably solid and bug-free. The modularity and excellent testing environment aid error control; and type mismatches are less dangerous than most other mistakes because they are easy to detect.

Another criticism of FORTH is its lack of a directory file structure. Again, this is historical and is not a characteristic of the language, which can be developed to use any kind of files.

The traditional FORTH file system is primitive, but in practice it has worked very well. The entire disk (or disks) is a single virtual array of blocks numbered from 1, with the block size standardized at 1024 bytes regardless of physical disk sector size. The blocks (called screens because they can be displayed as sixteen 64-character lines on a terminal) are automatically buffered so that they are physically read and written only when necessary. A LOAD command will read a given screen and treat the information exactly as if it had been typed in a terminal session, thereby compiling source code or executing commands (depending on the contents of the screen). The LOAD instruction can be executed within a screen; in this way, a single LOAD command can control the compilation of large source programs.

This disk-based file system allows any part of the disk to be read or written with a single access. Load screens or data areas can be saved by name, and portions of the disk can be protected by redefining the names of a few input and output operations so that they check before writing and/or reading.

The disadvantage of this system is that there is no directory; when a new disk is inserted, the user or the program must know the block numbers for load screens and data files. Also, FORTH source programs are traditionally stored without tabs or truncation of blank lines, making whitespace (ie: unused area on a line) and

space for comments costly in disk space and load time, discouraging good program layout. For these reasons, there is increasing interest in changing to a directory file system. Perhaps it will be written on top of the screen system currently in use.

۱

The most important criticism of FORTH is that its source programs are difficult to read. Some of this impression results from unfamiliarity with a language different from others in common use. However, much of it results from its historical development in systems work and in readonly-memory-based machine control, where very tight programming that sacrifices clarity for memory economy can be justified. Today's trend is strongly toward adequate commenting and design for readabili-

FORTH benefits most from a new, different programming style; techniques blindly carried over from other environments can produce cumbersome results. Most FORTH programmers seldom use named variables; they use the stack instead so that the implicit commenting normally available through choice of variable names is only provided through comments and user-defined operation names. Single definitions that would have more than about three unrelated numbers on the stack at any one time are best split into two or more operations; most programmers learn to keep their definitions short.

FORTH enforces extreme modularity, so the decomposition of each task into component parts is critical. Top-down design is especially important. Large jobs should be written as application-oriented libraries of operations to make teamwork and maintenance easier. A much larger fraction of the total programming effort is spent on design, with less on coding and debugging. For these and other reasons, FORTH creates its own issues of style, which are only beginning to be explored.

A Taste of FORTH

FORTH is an interactive language best explained by example. Because of this, a series of listings (listings 1 thru 10) with fairly detailed explanations make up the rest of this article. In the listings that follow, underlining denotes user keyboard input.

FORTH uses punctuation in some of its words, which makes representing them in text a difficult problem. For example, one FORTH word is ("), which could be taken to mean one of several character combinations. (For your information, the word has three characters and is made from a left parenthesis followed by a double quote mark and a right parenthesis.)

To decrease the chance of confusion while trying not to clutter text unnecessarily, we will sparingly use braces, $\{ \}$, to isolate the character string within as a FORTH word or phrase. (For example, the above word would be written $\{ (") \}$.) Braces will be used only under the following situations:

• when the material being quoted is a

phrase of FORTH words (eg: $\{26 \ LOAD \}$ or $\{35+\}$)

- with the FORTH words { . } (period),
 { , } (comma), { : } (colon), { ; }
 (semicolon), { ? } (question mark), { ! } (exclamation point), { ! } (single quote mark),
 and { " } (double quote mark)
- with any word using the above punctuation marks (eg: { \$. } or { ." }).

All other FORTH words will be set apart by a space on either side of the word. So, in this and other FORTH articles in this issue, braces will always signal a FORTH word or phrase. The braces are not part of the word or phrase, and FORTH words will never use braces within the body of a figure or listing....GW

On the Necessity of Using Camera-Ready Copy

Examination of listings 1 thru 10 will reveal a variety of typefaces used. This variety is present because each listing was created by the printer of the system producing the listing. Such listings are called camera-ready copy, which means that we can reproduce them in BYTE without inadvertently adding the errors that creep in with the retyping of a listing. Contributors to BYTE and onComputing are strongly encouraged to submit camera-ready listings made with a fresh ribbon, since this helps us to improve the accuracy of the article.

Listing 1: FORTH as a calculator. FORTH is easy to approach because it can be used as a calculator. Here, the programmer has not defined any new operation but has used addition, multiplication, and print (the dot means print). These are three of about one hundred operations that are available when FORTH first comes up. Programming consists of defining new operations which can be custom designed for a particular task or a particular industry.

FORTH uses postfix (also called RPN or reverse Polish notation) arithmetic, which is best known from its use in Hewlett-Packard calculators. In postfix notation, the operations are written after their arguments, not between them. The text of this article shows how postfix notation works, using a data structure called the stack, and it explains the formulas in this example.

Postfix notation, which does not use parentheses, is more general than ordinary arithmetic notation. Its biggest advantage is that it greatly simplifies the writing and calling of subroutines.

In these examples, underlining indicates what the user has typed on the terminal. FORTH does not process the line until you type a carriage return. The OK prompt means that the system has completed its work and is ready for new input from the user.

2 3 + . 5 0K 4 5 + 6 7 + * . 117 0K

Listing 2: Changing number bases. FORTH can work in different number bases and can change any time, so it serves as an octal/hexadecimal/ binary/decimal calculator within the limits of 16-bit numbers (or 32 bits for double precision). The FORTH word HEX converts FORTH into a hexadecimal machine, and all numbers are printed in Listing 2 continued on page 112

hexadecimal until some other operation changes the base again. FORTH always begins a session in decimal radix.

The operations DECIMAL and HEX are built into the system; OCTAL, BINARY, and TRINARY (base 3) are not. So when OCTAL was first used, the error message { OCTAL ? } indicated an undefined word; that is, the system did not recognize the word OCTAL. In the next line, the user defined OCTAL (line 6). This example illustrates FORTH's extensibility; users can extend the language to include new operators.

Incidentally, the second error message { 12885 ? } in line 12 resulted because the system was in binary (from the line above), and, in binary, numbers must contain only the digits 0 and 1, so 12885 was not recognized as a number. It was treated as a word, and, because there was no operation named 12885, the error message was generated.

OCTAL and the other number-base operations work by giving a new value to BASE, a variable used by the system. Defining new operations is more fully explained in listing 3. The { ! } operation (store) is explained later.

Number bases only affect input and output. All internal computation is in binary, so there is no speed penalty for using nondecimal numeric bases.

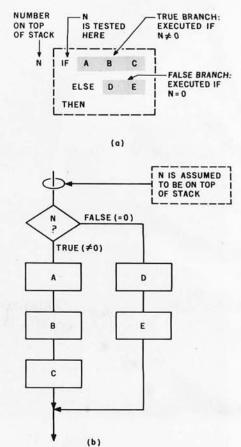

Figure 2: An explanation of the IF... ELSE ... THEN construct. (See listing 4.) As shown in figure 2a, the portion of code executed depends on the value of the number on top of the stack when the word IF is encountered. If we call this number N and say that the number has a boolean value of true if its numeric value is nonzero and false if 0, then figure 2b gives the equivalent construct to figure 2a in conventional flowchart notation. Here and in figures 3 thru 5, the dotted box indicates the boundaries of the construct (as opposed to values assumed to be on the stack).

Listing 3: Defining new operations. Here, a new operation CUBE is created. CUBE replaces whatever number is on top of the stack with the cube of that number. The statements within the parentheses are comments.

The colon, { : }, begins a FORTH word definition; the word following it is the name being defined. Semicolon, { ; }, ends the definition. The new word CUBE will first execute DUP, which duplicates the number on top of

The new word CUBE will first execute DUP, which duplicates the number on top of the stack, making a second copy. The second DUP leaves three copies. The first * causes the top two copies to be replaced by the square of the number; the next * computes the cube, and then all three copies of the original number are gone, leaving the cube of the number on top of the stack.

This colon definition *shows one of several ways to create new words in FORTH. Most words that appear inside the definition are compiled and not executed immediatelv.*

All words and numbers in FORTH are separated by one or more blanks (and/or carriage returns). FORTH operation names can be up to thirty-one characters long and can consist of letters, numbers, or any other characters. For example, an operation name could be a number, or it could be nonprinting characters only. In practice such names are rarely used, but they illustrate the flexibility that is available.

Listing 3 continued:

This listing shows CUBE being executed from the terminal. It can also be used as a component in further definitions. A fundamental property of FORTH is that operations defined by users are indistinguishable from those which were originally part of the system.

Listing 4: Conditional branching. The IF ... THEN is for conditional execution. IF takes one argument off of the stack; this argument is interpreted as a boolean or truth value, with 0 meaning false and any nonzero value meaning true. If true, any statements between the IF and THEN are executed. In either case, execution continues after the THEN, which terminates the conditional. There is also an optional ELSE clause that is executed only if the argument is false. (See figure 2.)

. Here, the true-clause contains only one word, MINUS, but it could contain almost any FORTH statements, including other conditionals and loops nested to any practical depth. These statements run fast because they are compiled into a form of object program called threaded code.

Incidentally, the FORTH word 0 < returns a boolean value indicating whether its argument (the number on top of the stack) is less than zero. The DUP is necessary because 0 < follows the FORTH convention that operations should destroy their arguments on the stack. MINUS reverses the sign of its argument (the top stack number).

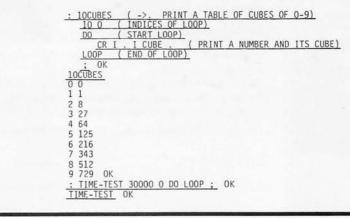

Items in parentheses are comments. The comment "N - N" in the first line is to show that this operation takes one number off of the stack and returns one number to it. Perhaps the most important information to put in the comments accompanying each new operation is what arguments it takes off of the stack and what results it returns to the stack.

: ABSOLUTE-VALUE (N -> N. ABSOLUTE VALUE) DUP O< (GET BOOLEAN, TRUE IF NEGATIVE) IF MINUS THEN (NEGATE THE NUMBER IF TRUE) ; OK 10 ABSOLUTE-VALUE . 10 OK -5 ABSOLUTE-VALUE . 5 OK

Listing 5: The DO ... LOOP, a structured loop with a counting index. DO takes two arguments from the stack, the initial value of the index (on top) and the final value plus 1. (See figure 3.) These indices are written in reverse order from most other languages, making the loop terminating value (which is more often passed as an argument) more accessible on the stack.

CR simply performs a carriage return. In this example, the index values are literals (10 and 0), but they can also come from variables or from computations of any complexity; anything that gets the indices onto the stack is legitimate.

This listing also shows a timing benchmark; the word TIME-TEST does 30,000 empty loops. On an Apple II running FORTH, TIME-TEST executes in less than 4 seconds. In Apple Integer BASIC (which is a fast BASIC), 30,000 empty loops take 40 seconds.

AMERICAN SQUARE COMPUTERS KIVETT DR • JAMESTOWN NC 27282 (919)-889-4577 **Listing 6:** The BEGIN ... UNTIL loop. This loop takes one argument, a truth value, usually computed within the loop, at the end. If it is false (0), control branches back to the corresponding BEGIN ; if the value is true (nonzero), the loop ends, and control transfers to the next word in the program. (See figure 4.)

Note that the test of the value on top of the stack occurs at the end of the body of the loop; this guarantees that the body of the loop will be executed at least once.

The word = removes the top two numbers from the stack and returns a truth value of 1 if they are equal, 0 otherwise. In this example, the index stays on the stack and is duplicated before each use. The DROP at the end throws away the top stack value; this prevents the used index from cluttering the stack.

The warning message "10CUBES ISN'T UNIQUE" notifies us that the same name has already been defined. The only penalty for reusing a name is that the former definition becomes inaccessible for the rest of the program. Therefore, you do not have to remember a list of reserved words in FORTH; if you do not know about a name or have forgotten about it, you probably were not planning to use it anyway. But, in case of a mistake, the bad definition can be deleted with a FORGET operation, or the source code can be changed on disk.

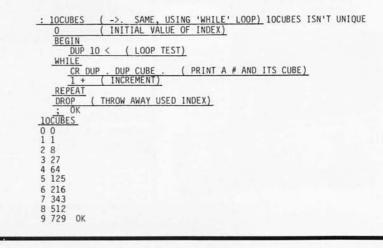

[Some versions of FORTH use BEGIN ... END instead of BEGIN ... UNTIL GW]

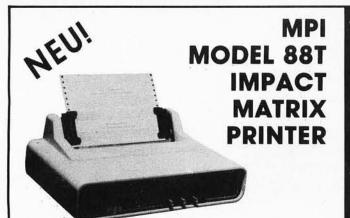

Listing 7: The BEGIN ... WHILE ... REPEAT loop. This looping structure tests the value on top of the stack at the beginning of the loop; because of this, this loop can execute 0 times. REPEAT causes an unconditional branch back to BEGIN , and WHILE branches out of the loop (just beyond REPEAT) if the truth-value which it finds on top of the stack is false (ie: 0); see figure 5.

All of these looping and conditional branching structures can be nested within each other to any practical depth. Any mismatching can be detected at compile time. Most FORTH systems allow these structures only inside colon definitions; they cannot be executed directly from the terminal.

[Some versions of FORTH use: BEGIN ... IF ... WHILE or WHILE ... PERFORM ... PEND instead of BEGIN ... WHILE ... REPEAT GW]

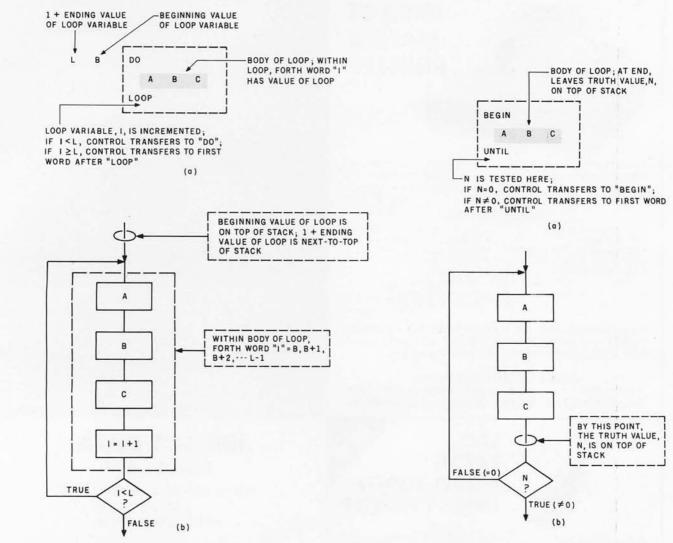

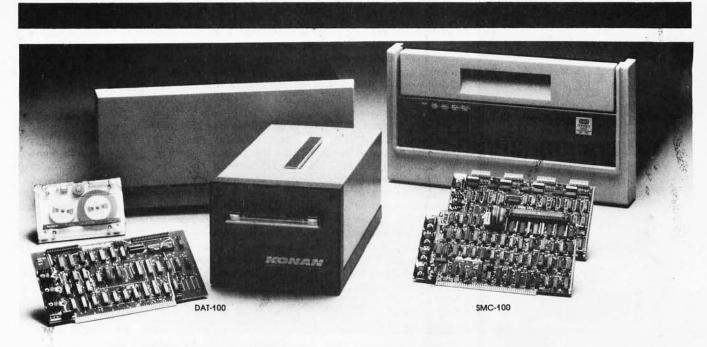

Figure 3: An explanation of the DO ... LOOP construct. As shown in figure 3a, the top number on the stack is taken to be the lower limit of the loop variable, I, and the next-to-top number on the stack is the upper limit of the loop variable + 1. The body of the loop is shaded, and the loop variable is incremented and tested after the body of the loop is executed. Figure 3b gives the equivalent construct in conventional flowchart notation.

Figure 4: An explanation of the BEGIN ... UNTIL construct. As shown in figure 4a, the body of the loop (shaded) is repeated only if the value on top of the stack when the word UNTIL is reached is false. Figure 4b gives the equivalent construct in conventional flowchart notation.

Hard disk and hardtape[™] control

Up to 2400 Megabytes of hard disk control for the S-100 bus.

Konan's SMC-100 interfaces S-100 bus micro computers with all hard disk drives having the Industry Standard SMD Interface. It is available with software drivers for most popular operating systems. Each SMC-100 controls up to 4 drives ranging from 8 to 600 megabytes per drive, including most "Winchester" drives -- such as Kennedy, Control Data, Fujitsu, Calcomp, Microdata, Memorex, Ampex, and others.

SMC-100 is a sophisticated, reliable system for transferring data at fast 6 to 10 megahertz rates with onboard sector buffering, sector interleaving, and DMA.

SMC-100's low cost-per-megabyte advanced technology keeps your micro computer system micro-priced. Excellent quantity discounts are available.

Konan's HARDTAPE[™] subsystem...very low cost tape and/or hard disk Winchester backup and more.

Konan's new DAT-100 Single Board Controller interfaces with a $171/_2$ megabyte (unformatted) cartridge tape drive as well as the Marksman Winchester disk drive by Century Data.

The DAT-100 "hardtape" system is the only logical way to provide backup for "Winchester" type hard disk systems. (Yields complete hard disk backup with data verification in 20-25 minutes.) Konan's HARDTAPE™ subsystem is available off the shelf as a complete tape and disk mass storage system or an inexpensive tape and / or disk subsystem.

Konan controllers and subsystems support most popular software packages including FAMOS[™], CP/M[®] version 2.X, and MP/M.

Konan, first (and still the leader) in highreliability tape and disk mass storage devices, offers OEM's, dealers and other users continuing diagnostic support and strong warranties. Usual delivery is off the shelf to 30 days with complete subsystems on hand for immediate delivery.

Listing 8: An example of FORTH looping. A practical use of FORTH's structured looping is this terminal output handler. This example is for a PDP-11; an example for other computers would be similar. Address 177564 (octal) is the output status register of the console terminal; bit 7 of this address is set when the device is ready to receive a character. The ASCII code for the output character can then be placed in address 177566 (the data buffer register).

The FORTH word @ (pronounced fetch) does the work of PEEK in BASIC; it treats the number on top of the stack as an address and replaces it with the contents of that address word. AND does a "bitwise" boolean AND operation. So { 177564 @ 200 AND } indicates true (nonzero) only if bit 7 of the status register is set. Until then, the BEGIN ... UNTIL loop does a waiting loop ending on the above condition. When the device is ready, the argument that was given to TERMINAL-OUT (the ASCII character to be written) is still on top of the stack. { ! } (pronounced store) stores the word that is second on the stack into the address that is on top of the stack; so { 177566 ! } transmits the character to the terminal data buffer register, from which it will be written onto the terminal by the hardware of the PDP-11 system.

The FORTH word ASCII-TEST was written to test the TERMINAL-OUT word. It transmits ASCII values for all of the printable character set.

Listing 9 shows the same device handler, only written in machine-language code with a FORTH assembler.

Listing 9: FORTH words defined by machine-language subroutines, for PDP-11 and for 8080 processors. The operation TERMINAL-OUT-2 behaves exactly the same as TERMINAL-OUT defined in listing 8, but it is written in assembly language. FORTH assemblers use postfix notation, so address-mode symbols and operation codes (instruction mnemonics) follow their operands, unlike conventional assemblers. In the PDP-11 example (listing 9a), { 177564 200 # BIT, } in line 2 assembles a "bit test" instruction that does a logical AND between address 177564 and the literal 200 (# indicates literal), setting condition codes. { UNTIL, } assembles a conditional branch back to the corresponding { BEGIN, }. The commas are part of the operation names, not punctuation. The word NE tells the { UNTIL, } what kind of conditional branch to assemble. There are also { IF, }...{ THEN, } and { IF, }...{ ELSE, }...{ THEN, } operations; all these code-level structures can be nested.

In the 8080 example (listing 9b), the machine-language subroutine sets up a call to the character-output routine in the North Star disk operating system. In contrast, the PDP-11 example outputs directly to the hardware without using any software outside of FORTH. Either approach could be used on either machine, of course, and each has its own advantages.

The word CODE, like $\{ : \}$ (colon, introduced in listing 3), creates a new definition in FORTH's dictionary for the word following it. CODE also sets the number base (to octal for PDP-11 and to hexadecimal for 8080), saving the original number base, which is later restored by $\{ C; \}$. CODE also changes the vocabulary, which allows the same names to have different meanings in the assembler and in the rest of FORTH without confusion. Users can create their own vocabularies and subvocabularies to keep different application libraries separate.

Many FORTH programmers never need to write machine-language subroutines, so they do not need to use an assembler. FORTH assemblers have an unfamiliar postfix notation, but they have the advantage of giving immediate feedback. You know right away whether an operation works, with no wait for assembly passes, linking passes, and file handling. This interactive assembly greatly speeds program development and allows more thorough testing.

"WHAT WOULD YOU SAY TO BIG COMPUTER PERFORMANCE FROM YOUR MICROCOMPUTER?"

"YOU'RE TALKING OUR LANGUAGE: PL/I-80."

New PL/I-80 from Digital Research Brings Big Computer Programming Power to Microcomputer Systems.

PL/I-80 is the biggest **news** for small system users and OEMs since we introduced CP/M® and MP/M. PL/I-80 is ANSI's General Purpose Subset of full PL/I, tailored into a language for 8080, 8085 and Z80 users who expect the software revolution they've seen in hardware -better results at lower cost. PL/I-80 works harder than any other generalpurpose language for business, science, research and education.

The PL/I-80 software package includes a native code compiler, comprehensive subroutine library, linkage editor and relocating macro assembler. And it's backed by our CP/M and MP/M operating systems.

Best of all, the complete PL/I-80 system diskette and documentation costs just \$500.

PL/I-80: There's no better way to get bigmachine results from your 8-bit processor.

Single-and Multi-User Operating Systems That Set Industry Standards.

CP/M is the industry standard operating system for small machines. With thousands of users throughout the world, it's the most popular and widely used. It's the original, hardwareindependent 'bus' for users working with a broad array of languages, word-processing and applications software available from scores of suppliers at affordable prices.

Now we've made a great CP/M even better. CP/M 2.2 is the latest release of the efficient, reliable system that's truly universal, able to manage virtually any 8080, 8085 or Z80 micro and its floppy or hard-disk subsystems. Named to the 1979 Datapro Software Honor Roll, CP/M comes on a diskette with its own operating manual, for just \$150 in unit quantity.

> 1979 MEMBER GOTOPTO SOFTWARE HONOR ROLL

MP/M provides bigcomputer power at small-computer cost. It provides multi-terminal access with multiprogramming at each terminal. And it's CP/M compatible, so you can run many programming languages, applications packages and development software on your system.

Check these advanced capabilities. Run editors, translators, word processors and background print spoolers simultaneously. Use MP/M's real-time facilities to monitor an assembly line and schedule programs automatically, or control a network of micros. Even write your own system processes for operation under MP/M. The possibilities are endless, yet MP/M costs just \$300 (unit price for diskette and manual).

Utilities That Work For You.

Use our utilities. Thousands do. They're designed to make your small system work extra hard, yet they cost surprisingly little.:

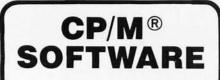

- MAC[™] (Macro Assembler)—\$90.
- SID[™] (Symbolic Instruction Debugger)—\$75.
- ZSID[™] (Z80 Symbolic Instruction Debugger)—\$100.
- TEX (Text Formatter)—\$75.
- DESPOOL[™] (Background Print Utility)—\$50.

All are supplied on a diskette, with operating manual.

8080 Emulator

RAID is a software-based system rivaling hardware emulators costing thousands of dollars. RAID is absolutely the most advanced and sophisticated debugging system ever developed for a computer. Fully symbolic, including labels, operands and op-code mnemonics, RAID combines real-time and emulation modes in a single package. Tracing by prime path, individual instructions, subroutines and breakpoints is supported. Special feature allows emulation and real-time modes to function together for high speed emulations. Other features include memory search facilities, disk access by track and sector, single-step, multi-step, block move, user-selectable radix, etc. Over 70 commands in all. Requires 24K min. Listing 10: User-defined data types. Because this example is longer, it was not typed in directly like the others, but was stored on disk with an editor (the editor session is not shown here). This example is contained in two disk screens, each of which is a virtual block of 1024 bytes (see text). The commands { 58 LIST } and { 59 LIST } print these screens. The line numbers (0 thru 15) are not part of the program and are used only by the editor.

This example creates table-lookup sine and cosine routines for integer-degree arguments. The results are accurate enough for most graphics applications, making this situation an example of the versatility of FORTH, even without floating-point routines.

The definition of TABLE creates a new data type. When TABLE is executed, it creates a new table of numbers taken from the stack; the number on top of the stack tells how many items there are in the table. In this case, { 91 TABLE SINTABLE } creates a table called SINTABLE with ninety-one entries; these entries are the values of the sine of 0° thru 90°, multiplied by 10,000 so that they can be expressed as integers. SINTABLE gives the sine (scaled by 10,000) of 0° thru 90° degrees; SIN does the same, except that its argument can be any number of degrees (from -32,768 to 32,767).

Incidentally, few FORTH programs use as much depth of stack as this one. The system used for listings 1 thru 7 limits the stack depth in order to use "page 0" memory for speed, so this example would have to be modified to run on it.

The *<*BUILDS ... DOES*>* construct, which creates the new data type, is one of the most advanced concepts of FORTH. Briefly, the *<*BUILDS part is executed when SINTABLE is defined; that is, it creates the table. The DOES*>* part defines what happens when SINTABLE is executed. Once TABLE has been defined, any number of tables of varying length can be declared using the word. Similar definitions can create special-purpose arrays such as word, byte, or bit arrays, user-defined record structures or other data objects, or user-defined classes of operations. [An excellent explanation of the words *<*BUILDS and DOES*>* is given in Kim Harris' article "FORTH Extensibility," also in this issue....GW]

The Netronics ASCII/BAUDOT Computer Terminal Kit is a microprocessor-controlled, stand alone keyboard/terminal requring no computer memory or software. It allows the use of either a 64 or 32 character by 16 line professional display for-mat with selectable baud rate, RS232-C or 20 ma. output, full

cursor control and 75 ohm composite video output. The keyboard follows the standard typewriter configuration and generates the entire 128 character ASCII upper/lower case and generates the entry is the characters. Features include onboard regulators, selectable parity, shift lock key, alpha lock jumper, a drive capability of one TTY load, and the ability to mate directly with almost any computer, including the new Ex-

directly with almost any computer, including the new Ex-plorer/85 and ELF products by Netronics. The Computer Terminal requires no 1/O mapping and includes 1k of memory, character generator, 2 key rollover, processor controlled cursor control, parallel ASCII/BAUDOT to serial conversion and serial to video processing—fully crystal controlled for superb accuracy. PC boards are the highest quality glass epoxy for the ultimate in reliability and lone life. long life

VIDEO DISPLAY SPECIFICATIONS

The heart of the Netronics Computer Terminal is the micro-processor-controlled Netronics Video Display Board (VID) which allows the terminal to utilize either a parallel ASCII or BAUDOT signal source. The VID converts the parallel data to serial data which is then formatted to either RS232-C or 20 ma.

serial data which is then formatted to either RS232-C or 20 ma. current loop output, which can be connected to the serial I/O on your computer or other interface, i.e., Modem. When connected to a computer, the computer must echo the character received. This data is received by the VID which processes the information, converting to data to video suitable to be displayed on a TV set (using an RF modulator) or on a video monitor. The VID generates the cursor, horizontal and vertical sync pulses and performs the housekeeping relative to which character and where it is to be displayed on the screen. Video Output: 1.5 P/P into 75 ohm (EIA RS-170) • Baud Rate: 110 and 300 ASCII . Outputs: RS232-C or 20 ma, current loop ASCII Character Set: 128 printable character

Start Computing For Just \$129.95 With An 8085-Based Professional Computer Kit-

Explorer/85

100% compatible with all 8080A and 8085 software & development tools!

No matter what your future computing plans may be, Level "A" — at \$129.95—is your starting point. Starting at just \$129.95 for a Level "A" operating system, you can now build the exact computer you want. Explorer/85 can be your beginner's system, OEM controller, or IBM-formatted 8" disk small business system...yet you're never forced to spend a penny for a component or feature you don't want and you can expand in small, affordable steps! Now, for just \$129.95, you can own the first level of a fully expandable computer with professional capabilities—a com-puter which features the advanced Intel 8085 cpu, thereby giving you immediate access to all software and development tools that exist for both the 8085 and its 8080A predecessor (they are 100% software compatible)—a computer which features onboard \$-100 bus expansion—plus instant conver-sion to mass storage disk memory with either 5-1/4" diskettes or standard IBM-formatted 8" disk. For just \$129.95 (plus the cost of a power supply, keyboard/ terminal and RF modulator, if you don't have them already), Explorer/85 lets you begin computing on a significant level... and/view to prioribe discussed in heading computer maga

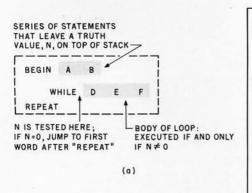

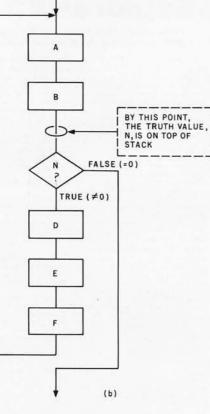

Figure 5: An explanation of the BEGIN ... WHILE ... REPEAT construct. As shown in figure 5a, the FORTH words between BEGIN and WHILE perform operations that leave a truth value, N, on top of the stack. The value of N determines whether the body of the loop (the words between WHILE and REPEAT) is performed or not. The loop repeats until N evaluates to false (N=0). Figure 5b gives the equivalent construct in conventional flowchart notation.

Text continued from page 10:

You should also look at FORTH if you have limited computer or financial resources. FORTH is a big language in a small package, and you can buy a version of FORTH for as little as \$20.(See "Selected FORTH Vendors," on page 98.) Unlike most new languages that gobble up more and more of the 64 K bytes allotted to an 8-bit microcomputer (some won't comfortably fit in 64 K bytes), there is plenty of room for very large FORTH programs even in a 16 K machine. FORTH takes up only about 8 K bytes, and this can be pared down; in an industrial application that will run only one program, the FORTH interpreter can be made as small as 800 bytes. Also, FORTH can be run on cassette-based systems due to its small size; although this is still more inconvenient than running FORTH on a disk system, most languages that use a disk are impractical or impossible on cassette-only systems.

Finally, you may want to consider FORTH for applications where speed is of the utmost importance. Since portions (or all) of a FORTH program can be written in the assembly language of the host computer, FORTH programs can be written that compare favorably in speed with machine-language programs. And, again, productivity is higher using FORTH than it is with machine language.

What Is a Threaded Language?

Imagine a language that starts with a few fundamental subroutines written in the machine language of the host computer; eg: routines to put a character to the display device, to get a character from the keyboard, to multipy two fixed-point numbers. Then imagine that the only way to combine these subroutines is to string them together (with embedded data bytes) as a series of subroutine calls: eg: a routine to get a signed multidigit number from the keyboard is written as a controlled series of calls to the subroutine that gets a character. Then these routines are called by other routines that perform even bigger tasks. For example, a routine to sum a series of signed numbers entered from the keyboard is written as series of subroutine calls that includes the one mentioned just above. The final pro-

Computer Hardware Professionals

Our clients, highly successful manufacturers and OEMs of Computer Systems, Electronic Systems, and Peripherals, have immediate openings for Hardware Development Professionals to work on FUTURE SYSTEMS PROJECTS. Such projects include COMPUTER ARCHITECTURE, DATA COMMUNICA-TIONS, PERIPHERAL DEVELOPMENT, and POWER SUPPLY DESIGN. Specific openings currently exist at Senior and Intermediate levels for:

COMPUTER ARCHITECTS - Definition and development of Micro- Mini-computer systems.

POWER SUPPLY DESIGN ENGINEERS — Switching regulators for Off-Line Power supplies. Experience in High Frequency P.W.M. techniques and AC Power Distribution would be desirable. MICROPROCESSOR DESIGN ENGINEERS — Design/Development of state-of-the-art Microprocessor based systems and interfaces. Experience on any Microprocessor acceptable.

based systems and interfaces. Experience on any Microprocessor acceptable. LSI DESIGN DEVELOPMENT — Numerous positions with local systems oriented firms in LSI technology development.

CPU DESIGN ENGINEERS — BSEE/BSCS and/or experience in the design of Digital Computers or Microprocessor systems. Requires an understanding of Software, i.e. ASSEMBLY, FORTRAN, or PL-1. DIGITAL LOGIC AND CIRCUIT DESIGN ENGINEERS — Logic and Circuit design plus a familiarity with TTL, CMOS, LSI/VLSI, etc.

ANALOG DESIGNERS — 30 to 40 megahertz Phase Lock loop experience. Experience with 80 megahertz power drivers and DC motors.

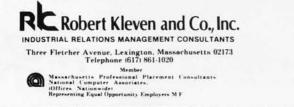

PCB DESIGNERS - With CAD experience.

COMMUNICATIONS SYSTEMS DEVELOPERS - Experience with store and forward message switching, Network Data Link Control, and/or PBX and EPX Systems.

Compensation on all positions ranges from low 20's to low 40's, based upon experience. Client companies are equal opportunity/affirmative action employers, provide excellent benefits, and assume all fees.

Qualified applicants will receive IMMEDIATE RESPONSE and are invited to contact: Don Bateman, in strict confidence, at (617) 861-1020. Or submit current resume to him for review. For those who find it inconvenient to call during working hours, our office will be open until 7:30 p.m.

Special Notation Used in This Issue

Because FORTH is such an unusual language (it uses punctuation marks by themselves and within words), a pair of braces, { }, is sometimes used to set apart FORTH words from the rest of the text. Braces are used under the following conditions:

- When the material being quoted is a series of FORTH words; eg: { 26 LOAD } ;
- When the FORTH word is or contains any of the following punctuation marks: period, comma, colon, question mark, exclamation point, single quote mark, or double quote mark. Two examples are { . } and { (") }.

In addition, spaces are always used to separate FORTH words from other words or punctuation—even when this means doing something like "...the words BEGIN , WHILE , and REPEAT are all..." (spaces between FORTH words and the commas that follow them). There are two reasons for doing this: first, for clarity; and second, to emphasize that the FORTH word in question does not include the punctuation that follows. Some FORTH words do contain punctuation (eg: { IF, }), but such words will always be enclosed in braces (except within program listings).

gram in such a *threaded language* is a series of calls to lower and lower subroutines, dipping repeatedly into machine-language routines under the control of higher-level routines. The addresses in each subroutine that point to the subroutine or machine language under it make up a "thread" of control that runs through the entire program.

FORTH has so far been implemented as a threaded language. *Threadedness is a language implementation technique, not an inherent quality of any language;* SNOBOL and FORTRAN compilers have been written using threaded code.

FORTH: Pro and Con

Pros: I have already mentioned most of the advantages of FORTH. The language is:

- Compact;
- Fast, although this is due to its implementation in threaded code, not its inherent qualities;
- Structured: it has the major constructs of structured programming and, in fact, does not have any kind of goto statement, thus forcing it to be structured;
- Extensible;
- Highly portable.

These last two features deserve further description. The *extensibility* of FORTH is probably its most important feature. Never before in a highlevel language has it been so easy to add new features, new data types, and new operators to a language. Unlike other languages, these new words (everything in FORTH is called a *word*) have the same priority and receive the same treatment as words defined in the standard FORTH vocabulary. For example, you can define a word 10+ that will add ten to any number it is given; or, in fact, you can even redefine the addition operator + . You can also define entirely new families of words in FORTH. This advanced topic is ably discussed in what I believe is the only written treatment of the subject *anywhere* in FORTH literature by Kim Harris in his article, "FORTH Extensibility," on page 164.

Most FORTH programs can be transferred from, say, a mainframe computer to a microcomputer without modification; therefore, FORTH is highly portable. Most of the FORTH words supplied in a given system have been defined to do the same operation regardless of the computer used. Although the vocabulary of words varies from supplier to supplier, most FORTH programs will run with minor or no modifications. A standard set of words, called FORTH-79, collectively developed by many of the major suppliers and users of FORTH, will help in this situation.

Cons: Here are some of the disadvantages of FORTH:

FORTH code is hard to read.

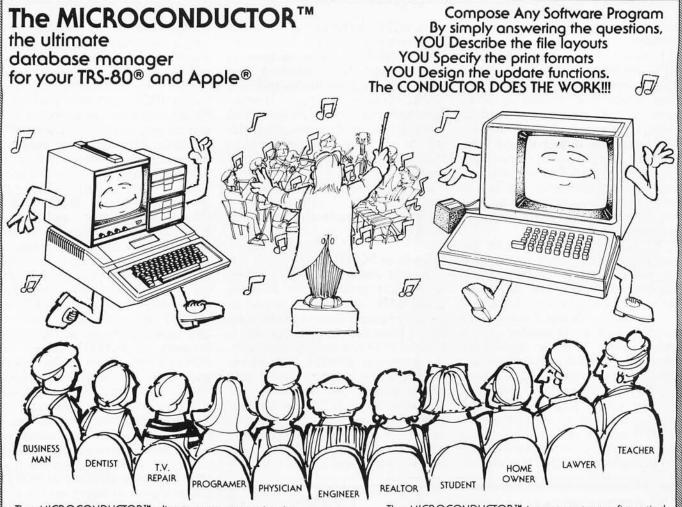

This is probably the most common complaint against the language. As a new user, I can say that you slowly get used to the odd syntax of the language. The stack architecture (see below) of the language contributes to the novice's initial disorientation, but this feeling is usually blamed on the unreadability of the language. In addition, the stack architecture encourages the storage of working values on the stack rather than in variables with names. Variable names, if chosen properly, give vital clues to the workings of a program; this scarcity of variable names makes most FORTH programs less readable. Adequate indentation and comments can help a FORTH program, but programmers of FORTH, like programmers of all other languages, often omit these aids to comprehension.

• The stack architecture of FORTH offers disadvantages as well as advantages. Remember the odd feeling you got the first time you used a Hewlett-Packard calculator and had to punch in "5 ENTER 3 + " instead of the more understandable " 5 + 3 = " ? FORTH uses the same reverse Polish notation (abbreviated RPN), where the objects being entered come before the operators that work on them.

Not only does this take some getting used to (it takes even longer before you can fluently "think in FORTH"), it also encourages a scarcity of named variables, as mentioned above. In addition, stack-manipulating words like SWAP, DUP (for duplicating the top entry on the stack), ROT (for rotating the top three items on the stack), and others muddle the FORTH program and make it hard to tell just what variable is being operated on. This uncertainty is particularly evident during debugging; most of your time is spent finding out why what you thought was on the stack isn't there.

• FORTH encourages programming "tricks" in place of plain, easier to read programming. Although the examples to support this statement have already been mentioned, I think the statement as a generality is true. We must remember that, especially since lack of memory is usually not a problem in FORTH, FORTH programmers should name appropriate variables and, in general, worry less about fitting a program on one screen (a basic unit of FORTH program-

The MICROCONDUCTOR[™] directs your computer to compose, organize and summarize all information you need to solve your software and business problems.

With The MICROCONDUCTOR[™], your computer will be able to compose any record-keeping software you need. In the office, The MICROCONDUCTOR[™] can help with anything from accounts receivable to property management. You'll find that The MICROCONDUCTOR[™] is ideal for the shop too. Let it take care of your inventory records, sales analysis, price lists, and more.

The MICROCONDUCTOR[™] is not just a file manager but a true Data Base Management System suitable for both the novice and professional users.

Some of the modules of this masterpiece are:

- DATA FILE—One step file creation. Just set it, and forget it. MAINT.— Manipulate your data files with ease; add,
- SORT— delete, modify, scan, relocate, and more. Sort any number of fields, in any sequence, ascending or descending order.
- UPDATE Single or dual file report and update utility.

ming) and more about making it readable.

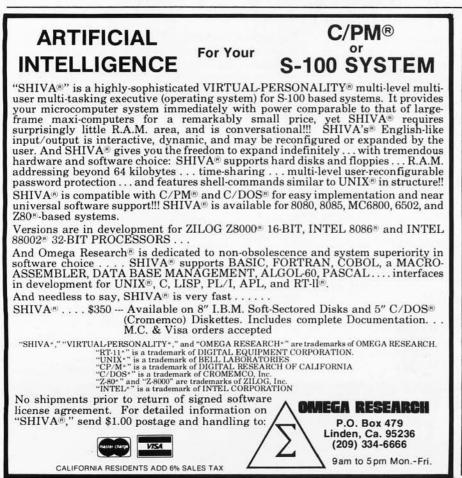

However, drawing a comparison to APL, *any* language that compresses a lot of program into a small number of lines suffers from readability problems. Broad, powerful algorithms often represent complex processes; when they are described in a terse notation, they look like programming tricks. In this case, the only remedy is to use a lot of comments. The lack of such comments is solely the fault of the programmer, not of the computer language.

FORTH lacks many of the programming constructs we are used to-strings, arrays, floating-point numbers-but that's not the whole story. Many applications, for example, can get by without floating-point numbers: look at the number of programs written in Integer BASIC for the Apple II. With a maximum absolute numeric value of 32,767, normal FORTH can handle many problems by simply assuming a decimal point. In addition, all versions of FORTH can add all these features and more, simply by defining new words. For example, MMSFORTH, a version

of FORTH for the TRS-80 by Miller Microcomputer Services, has over ten screens (each *screen* is 16 lines of source code) that implement their version of words for double-precision math, arrays, strings, random numbers, and TRS-80 graphics. You compile a series of screens, thus adding to the size of your resident FORTH interpreter, only if you need these features. So you can have all these programming constructs and tools, but only if you write them yourself or get somebody else to write them for you.

Friends of FORTH

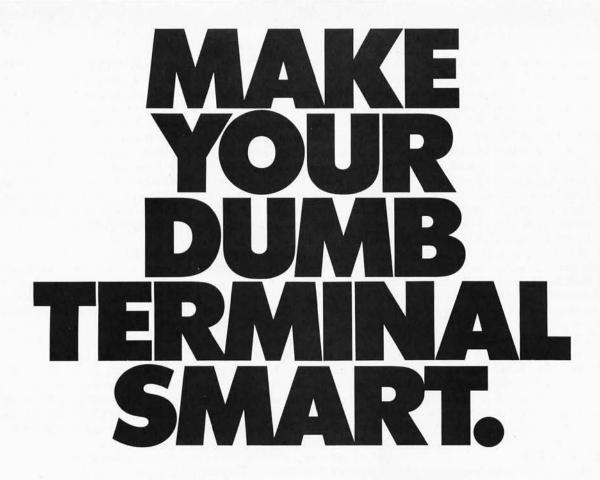

Almost everyone who is working in FORTH professionally is doing good work, but a few people or groups of people deserve special mention. Foremost in this group is Charles H Moore and, through him, the company FORTH Inc. Moore developed the language over a long period of time (see his article "The Evolution of FORTH, an Unusual Language," on page 76) and promoted it through his company FORTH Inc. Elizabeth Rather, who contributed significantly to the

development of the language and who is vice-president at FORTH Inc, should also be mentioned in this context.

Then there is the FORTH Interest Group (POB 1105, San Carlos CA 94070), without whose efforts lowcost versions of FORTH would not be available. Although many people in the group have contributed to its working, names that must be mentioned are Bill Ragsdale (coordinator), Dave Boulton, Kim Harris, John James, and George Maverick. Over the past two years, this group has collectively raised its membership from a few dozen people in northern California to over a thousand members worldwide. In the process, they have also publicized FORTH at numerous conventions and have distributed public-domain versions of FORTH (called fig-FORTH) for all the major microprocessors; ie: 8080, 6800, 6502, 9900, PACE, and LSI-11. Although they supply only listings and documentation, versions customized for various popular microcomputers are available inexpensively. In addition, they are working on standardizing certain extensions to FORTH (floating-point numbers, arrays, etc), and they publish a very professionallooking bimonthly magazine called FORTH Dimensions. The group has monthly meetings at the Liberty House Department Store in Hayward, California, on (what else?) the fourth Saturday of each month. Membership in the FORTH Interest Group (which includes a subscription to its magazine) is \$12 per year, \$15 overseas.

A final group that must be mentioned is Miller Microcomputer Services of Natick, Massachusetts, which sells and supports a version of FORTH, called MMSFORTH, and other related FORTH products for the Radio Shack TRS-80 Model I. Not only do they provide a fine version of FORTH with arrays, strings, graphics, and other extensions, they are the only microcomputer-FORTH vendor that supports its product with both information and new vocabularies of FORTH words. (For example, they have a set of FORTH words that add 6- and 15-digit floating-point arithmetic, complex numbers, and a full Z80 assembler, all for \$29.95.) They also publish an MMSFORTH Newsletter that always has some

Teach it to talk back. The SLC-1 Time Machine replies instantly to requests from your computer. It automatically tells it the date and time, enters log-in codes, gives any responses you specify. No changes are required in your operating system. Simply install it in the RS-232 or 20mA current loop serial link that connects your computer and terminal.

No more operator response errors. No more delays. Now you can automatically re-boot your system after power failure.

Whether you use your computer for business, research, or process control, the Time Machine will save you money. In

fact, the first time it prevents a human error, it will more than pay for itself.

The Time Machine doesn't interfere with your computer's operation. It steps in and responds only when it sees the key phrases you have specified. And because it's battery-supported, it never misses a beat or a bit.

The Time Machine comes with a built-in bonus: it is also an independent microprocessor system. Its 1,000 bytes of RAM (expandable to 12K) lets you use it in the off-line mode to free your computer for other tasks. Applications support is available, including a growing 6502 machine language software library.

The single quantity price is only \$640. Ten-digit display option, \$190. For more information or literature on the SLC-1

goodies you'd expect to pay money for. The people at MMSFORTH are A Richard (Dick) Miller and Judy Miller, along with free-lance programmer Tom Dowling, who wrote MMSFORTH for the TRS-80.

In addition, the major vendors of FORTH should be commended for the way they have worked and are working together to help standardize the language. The people mentioned above, along with the European FORTH Users' Group (EFUG), have met as the International FORTH Standards Team to work out a standard set of FORTH words (with standard behavior) that can be used to increase the already high portability of FORTH programs. Once the proposed FORTH-79 standard is approved by this standards team, FORTH Inc, the FORTH Interest Group, and Miller Microcomputer Services have indicated that they will bring out new FORTH versions conforming to this standard.

Variants of FORTH

A few other FORTH-like languages should be mentioned here. URTH (University of Rochester THreaded language) is simply FORTH by another name. I am told that CON-VERS, an experimental language that was offered by the Digital Group, is a FORTH-like language.

STOIC is a language that is different from FORTH primarily in some small syntax rules, although its enthusiasts claim it is more powerful than FORTH. From reading the documentation, I have found that STOIC interacts differently and has more sophisticated disk access than FORTH. CP/M Users Group (1651 Third Ave, New York NY 10028) distributes STOIC on two 8-inch single-density CP/M floppy disks; the cost is \$20, which includes postage, documentation (on CP/M DOC files), and group membership fees. STOIC was developed by Roger G Mark and Stephen K Burns in the Biomedical Engineering Center for Clinical Instrumentation, funded by the Harvard-MIT Program in Health Sciences and Technology in Cambridge, Massachusetts.

Also, I am very excited about a book nearing publication: *Threaded Interpretive Languages* by Ron Loeliger. This book, to be published

soon by BYTE Books, delves deeper into the practical aspects of designing and implementing a threaded language than any book I have seen. Not only does it demonstrate exactly how the machine code must work, it also details the specific implementation of ZIP (which looks like FORTH under another name) in Z80 assembly language. The book promises to be *the* definitive work on how threaded languages perform.

Final Notes

As we received more and more FORTH articles, I realized that we would soon have too many for this special August issue. I immediately scheduled for subsequent nontheme issues those extra articles we could not use at this time, a process known as "holding down the FORTH." In any case, we have several FORTH articles that will appear in upcoming issues of BYTE. These include an article on recursion in FORTH by George Flammer, a tutorial on stringmanipulating FORTH words by John Cassady, a history of the FORTH Standards Team by Bill Ragsdale, and a detailed discussion of the different kinds of threaded codes by Terry Ritter and Gregory Walker.

We hope you will enjoy looking at the FORTH tapestry presented in this issue.

Articles Policy

BYTE is continually seeking quality manuscripts written by individuals who are applying personal computer systems, designing such systems, or who have knowledge which will prove useful to our readers. For a more formal description of procedures and requirements, potential authors should send a large (9 by 12 inch, 30.5 by 22.8 cm), self-addressed envelope, with 28 cents US postage affixed, to BYTE Author's Guide, 70 Main St, Peterborough NH 03458.

Articles which are accepted are purchased with a rate of up to \$50 per magazine page, based on technical quality and suitability for BYTE's readership. Each month, the authors of the two leading articles in the reader poll (BYTE's Ongoing Monitor Box or "BOMB") are presented with bonus checks of \$100 and \$50. Unsolicited materials should be accompanied by full name and address, as well as return postage.

SYSTEM MAINTENANCE

DIAGNOSTICS I: Easily the most comprehensive set of CP/M compatible system check-out programs ever assembled. Finds hardware errors in your system, confirms suspicions, or just gives your system a clean bill of health. Tests

- CPU (8080/8085/Z80) Memory Terminal
- Disk · Printer

To our knowledge the CPU test is the first of its kind anywhere. Diagnostics I can help you find problems before they become serious. A good set of diagnostic Minimal requirements: 24K CP/M. Supplied with complete user manual:

\$60.00 Manual alone: \$15.00.

ACCOUNTING-

ACCOUNTS PAYABLE/RECEIVABLE: A complete, user oriented package which features:

automatic postings to general ledger (optional)

- · check printing with invoice · invoice aging accounts payable:
- accounts receivable · progress billing · customer statements

 invoice aging · partial invoice payments

The entire package is menu driven and easy to learn and use. It incorporates error checking and excellent user displays. This package can be used stand alone or with the General Ledger below.

Supplied with extensive user manual: \$200.00. Manual alone: \$20.00.

GENERAL LEDGER: A complete, user oriented package which features.

- · Accepts postings from external programs (i.e. AP/AR above)
- Accepts directly entered postings
- Maintains account balances for current month, guarter, and year and previous three quarters

Financial reports: trial balance, income statement balance sheet, and more

Completely menu driven and easy to learn and use. Excellent displays and error checking for trouble free operation. Can be used stand alone or with Accounts Payable/Receivable above.

Supplied with extensive user manual: \$200.00. Manual alone: \$20.00 Both require 48K CP/M, terminal with cursor positioning, home and clear home, one 8" disk or Two 5" disks. CBASIC2 required.

TEXT PROCESSING

TFS-Text Formatting System: An extremely powerful formatter. More than 50 commands. Supports all major features including:

- · left & right margin justification
- · user defined macros · underlining and backspace · dynamic insertion from disk file

TFS lets you make multiple copies of any text. For example: Personalized form letters complete with name & address & other insertions from a disk file. Text is not limited to the size of RAM making TFS perfect for reports or any big job.

Text is entered using CP/M standard editor or most any CP/M compatible editor. TFS will link completely with Super-M-List making personalized form letters easy

Requires: 24K CP/M.

Supplied with extensive user manual: \$85.00. Manual alone: \$20.00 Source to TFS in 8080 assembler (can be assembled using standard CP/M assembler) plus user manual: \$250.00.

MAILING LIST

SUPER-M-LIST: A complete, easy to use mailing list program package. Allows for two names, two address, city, state, zip and a three digit code field for added flexibility. Super-M-List can sort on any field and produce mailing labels direct to printer or disk file for later printing or use by other programs. Super-M List is the perfect companion to TFS. Handles 1981 Zip Codes!

Requires: 48K CP/M. Supplied with complete user manual: \$75.00.

UTILITIES

Manual alone: \$10.00

Utility pack #1: A collection of programs that you will find useful and maybe even necessary in your daily work (we did!). Includes:

CMP: Compare two files for equality.

- ARCHIVER: Compacts many files into one, useful when you run out of directory entries
 - In core sort of variable length records SORT
 - XDIR: Extended, alphabetical directory listing with groupings by common extension
 - PRIN1 Formatted listings to printer. Lists files to CRT a page at a time. PG
- plus more . Requires: 24K CP/M
- Supplied with instructions on discette: \$50.00.

PROGRAMMING LANGUAGES

FORTH: a full, extended FORTH interpreter/compiler produces COMPACT, ROMABLE code. As fast as compiled FORTRAN, as easy to use as interactive BASIC

SELF COMPILING: Includes every line of source code necessary to recompile itself.

EXTENSIBLE: Adds functions at will. Z80 & 8080 ASSEMBLERS included Single license, OEM licensing available Please specify CPU type: Z80 or 8080 Supplied with extensive user manual and tutorial: \$150.00 Documentation alone: \$25.00

ENHANCED 'TINY' PASCAL: We still call it 'Tiny' but it's bigger and better than ever! This is the Famous Chung/Yuen 'Tiny' Pascal with more features added. Features include

- recursive procedures/functions integer arithmetic CASE
- · sequential disk I/O · one dimensional arrays FOR (loop) • IF
 - WHILE
 - . EL SE · 'PEAK' & 'POKE' • REPEAT UNTIL • more

 READ & WRITE 'Tiny' Pascal is fast. Programs execute up to ten times faster than similar BASIC programs

SOURCE TOO! We still distribute source, in 'Tiny' Pascal, on each discette sold. You can even recompile the compiler, add features or just gain insight into compiler construction.

Tiny' Pascal is perfect for writing text processors, real time control systems. virtually any application which requires high speed. Requires: 36K CP/M. Supplied with complete user manual and source on discette: \$85.00.

Manual alone: \$10.00.

SOFTWARE SECURITY

ENCODE/DECODE: A complete software security system for CP/M. Encode/ Decode is a sophisticated coding program package which transforms data stored on disk into coded text which is completely unrecognizable. Encode/Decode supports multiple security levels and passwords. A user defined combination (One billion possible) is used to code and decode a file. Uses are unlimited. Below are a few examples:

- data bases
- general ledger inventory
- payroll files
 - correspondence · tax records
- programs
- · accounts pay/rec
- · mailing lists

Encode/Decode is available in two versions:

Encode/Decode I provides a level of security suitable for normal use. Encode/Decode II provides enhanced security for the most demanding needs. Both versions come supplied on discette and with a complete user manual.

Encode/Decode I: \$50.00 Encode/Decode II: \$100.00

Manual alone: \$15.00

INTERCOMPUTER COMMUNICATIONS

TERM: a complete intercommunications package for linking your computer to other computers. Link either to other CP/M computers or to large timesharing systems. TERM is comparable to other systems but costs less, delivers more and source is provided on discette!

With TERM you can send and receive ASCII and Hex files (COM too, with included convertion program) with any other CP/M computer which has TERM or compatible package. Allows real time communication between users on separate systems as well as acting as timesharing terminal.

- · Engage/disengage printer · error checking and auto retry
- · terminal mode for timesharing between systems · conversational mode
- send files

Supplied with user manual and 8080 source code: \$110.00

ALTOS BREAKS THE MICRO BARRIER.

Yesterday, microcomputer meant micro performance. Once you outgrew it, you had to step up to a mini. Which meant a big step up in price. Today, there's the new Altos ACS8000-6 single-

board microcomputer system.

It's the first system for the OEM, small businessman and personal user, that offers minicomputer performance and minicomputer storage capacities at a microcomputer price.

MULTI-USER, WINCHESTER STORAGE, FLOPPY BACK UP: \$14,260.

The new Altos ACS8000-6 is a highly advanced Z80* based microcomputer system with high-speed

ALTOS

ALCON

RAM, floppy disk and Winchester harddisk controllers, DMA, six serial and two parallel I/O ports and the AMD 9511 floating point processor all on a single board. A typical four-user system configuration with two megabytes of Shugart floppy and 29.0 megabytes of Shugart Winchester storage, including CPU and 208K bytes of RAM, costs only \$14,260-compared to \$30,000 or more for a similar minicomputer system. And that adds up to mini performance at less than half the cost!

MULTI-USER EXECUTIVE SUPPORTS FOUR INDEPENDENT USERS RUNNING CP/M** COMPATIBLE PROGRAMS.

This revolutionary new microcomputer system features the MP/M** Multi-User Executive software program that's unique in two ways. It includes a multi-user CP/M capability and the ability to handle Winchester-type hard disks. The advanced Z80 operating program supports four independent CP/M compatible programs in any of six popular languages: BASIC, FORTRAN, COBOL, PASCAL, APL, C, and a large assortment of additional business application packages. MP/M is compatible with both the 1.4 and 2.0 versions of Digital Research's CP/M, which means programs based on either version can run under MP/M without modification.

With MP/M at the helm, your Altos ACS8000-6 system can support up to four simultaneous users with 48K bytes of RAM each plus 58 megabytes of Winchester storage and 4 megabytes of floppy back up. And that adds up to the first microcomputer to give you the power and

performance of a minicomputer. SINGLE-USER, HARD-DISK SYSTEMS START AT \$9450.

The Altos ACS8000-6 series. It's a barrier breaker in every sense. Our entrylevel, single-user, hard-disc system with floppy back up is priced under \$10,000 and even our 4-user CP/M model is available for under \$12,000. And all configurations are easily upgraded.  hardware-oriented control and status

The main characteristics for the host level are:

- parallel data transfer
- formatting/de-formatting included in drive electronics
- function-oriented control and status by functional command like read/write sector and format

Device-level interfaces can be divided into four groups:

- ANSI
- ANSI-like

- SMD
- Floppy-disk-like

The ANSI interface, as far as it is currently defined, will use a single 50-conductor flat cable. Up to four drives can be connected in a daisychain configuration. Differential drivers and receivers will be used only for block and data signals for read and write functions. All other lines will use standard TTL (transistor-transistor logic) signals. Control commands and status information will be transferred over an 8-bit-wide bidirectional bus. The bus control lines use an asynchronous handshake mechanism, allowing simple adaptation of the bus speed to any microprocessor. Data is transferred in

serial NRZ (nonreturn-to-zero) format separated from the clock signal.

In the ANSI-like interface, most of the current device-level interfaces are more or less similar to the ANSI interface. Common to all are an 8-bit parallel control bus and serial NRZ data transfer.

SMD (storage module drive) interface is a de facto industry standard for 14-inch drives and is being adapted for 14-inch drives by ANSI. It has also been implemented for 8-inch drives. The SMD interface uses differential drivers and receivers for all signals. (They give excellent performance as regards high speed, long cable lengths, and high noise immunity.) The drives are connected through

one daisy-chain cable for control and one radial cable for read/write and additional control. Control information is transferred on a 10-bit-wide unidirectional synchronous bus. Data is transferred in serial NRZ format.

The SMD interface allows very high transfer rates and long cable lengths. Because SMD uses differential drivers and receivers for all signals, it is somewhat more costly than other interfaces using TTL circuits. Because of the 10-bit synchronous bus structure, SMD is not easy to interface to current 8-bit processors. The main advantage of SMD for 8-inch drives is that it is a standard, and controllers are readily *available* for easy integration into existing or currently supplied systems.

Having a floppy-disk-like interface for 8-inch hard disks allows the combination of floppy-disk drives and hard-disk drives in one system. Because of the differences in transfer rates and other parameters, floppyand hard-disk drives are not fully interface-compatible. Hard-disk users must add a radial cable for differential read/write signals in addition to the normally used daisy-chain cable. By adding 15% to 20% more circuitry, a hard-disk controller can be designed to also control floppy-disk drives. However, a floppy-disk controller cannot handle a Winchestertype hard-disk drive.

In comparing floppy-disk-like interfaces with other device-level interfaces, there are three major differ-

ences. First, with floppy-disk-like interfaces there is no control bus because commands and status signals are transferred on discrete lines. Second, positioning control is achieved with step and direction signals as opposed to the transfer of a parallel-cylinder address with other interfaces. Third, data is transferred in the raw format as recorded on the disk. This implies that synchronization, separation (or generation) of clock and data, and generation and detection of sector and address marks must all be performed externally to the drive. The floppy-disk-like concept minimizes drive electronics, but puts the burden of developing and producing the balance of the required electronics on the user.

Anatomy of a Threaded Language

Threaded languages (such as FORTH) are an exciting new class of languages. They are compact and fast, giving the speed of assembly language with the programming ease of BASIC, and combine features found in no other programming languages. An increasing number of people are using them, but few know much about how they work. Is a threaded language interpreted or compiled? How much memory overhead does it require? Just what is an "inner interpreter"? **Threaded Interpretive Languages**, by R. G. Loeliger, concentrates on the development of an interactive, extensible language with specific routines for the ZILOG Z80 microprocessor. With the core interpreter, assembler, and data type defining words covered in the text, it is possible to design and implement programs for almost any application imaginable. Since the language itself is highly segmented into very short routines, it is easy to design equivalent routines for different processors and produce an equivalent threaded interpretive language for other development systems. If you are interested in learning how to write better FORTH programs or you want to design your own powerful, but low-cost, threaded language specific to your needs, this book is for you.

A NEW WORLD OF SMALL COMPUTERS IS AT YOUR FINGERTIPS THIS FALL

4th Annual NATIONAL SMALL COMPUTER SHOW

New York Coliseum, October 30 to Nov. 1, 1980

When we say "fingertips" we mean just that: a hands-on-inspection opportunity for you to try the small computers and systems that will write the history of microprocessing in the 1980's.

Manufacturers will fill over 30,000 square feet with computers, software and peripherals. Amazing strides in technology are reflected in exhibits and lecture series.

New hardware and software for business, education, the sciences and professions, graphics and personal use are being gathered for the largest and most beautifully presented National Small Computer Show ever produced.

As always, the show contains attractions for the seasoned computer professional, as well as those who wish an introduction to the exciting world of small computers for business, professional or personal use. In just a short time, you can discuss your interest with many industry leaders, vendors, technologists, and our expert lecturers.

Registration fee is only \$10 per day, and all registrants have free access to the hourly lectures.

Host-Level Interface

A typical implementation for hostlevel interface is the BASF 6170 series drive with integral formatter/controller. The BASF host bus interface uses a single daisy-chain cable that can connect one or more units to the host adapter. Transfer of data, command, and status information is done across one common 8-bit-wide bidirectional asynchronous bus. The eight bus lines, as well as additional lines for bus control and interrupt generation, all use standard TTL drivers and receivers. Using a hostlevel interface is the easiest and fastest way to interface an 8-inch Winchester drive to a given host system.

How Intelligent Should a Controller Be?

With the decreasing cost of microprocessors and memories, the trend is toward the use of intelligent subsystems to handle all I/O-related

functions, rather than tying up the processor.

These subsystems can communicate with the main system through a high-level command language (eg: one that is file-oriented as opposed to hardware-oriented). Functions such as automatic backup, automatic error recovery, power-on bootstrap loading, etc, can be completely controlled locally in the subsystem, thus taking the burden off the main processor and improving the system's performance.

Further improvement can be gained by adding hardware and software for such things as double-buffering for data transfer, overlapped operation in a multiple drive configuration, and RPS (rotational-positioning sensing) for access optimization.

There is a limit to the transparency of the disk system to the operating system. If a disk with higher packing density is substituted, the number of sectors on each track or the number of tracks per surface will likely be different. This information must be communicated to the operating system. (With luck, this is a small parameter change in the I/O driver of a well-designed, modular operating system). But, however easy or difficult it is to change, it must be done to take full advantage of the new higher-capacity drive.

The Question of Backup for Fixed Disks

The usefulness of removable media on fixed-disk-based systems arises from three needs:

- system backup for crash/fault recovery
- program and data-base dissemination
- archival storage of information

The excellent reliability record of Winchester-technology disks is caus-

ing some system builders and users to take a fresh look at backup requirements for data storage. They are concluding that, for *some* applications, it is no longer necessary to include removable media for backup protection in systems design.

Error-correcting capabilities of system software and intelligent controllers help to eliminate the need for backup in some cases. However, there will probably always be applications—perhaps the majority—in which backup cannot be eliminated. Many systems require removable media for program and data-base dissemination and/or archival storage in addition to any backup considerations. Therefore, it seems that there will be a continuing need for removable-media storage peripherals on some fixed-disk-based systems.

According to many small-system designers and users, system backup is needed regardless of the *hardware*

reliability of the fixed-storage subsystem. System crashes or failures can be caused by software bugs and human error as well as by hardware faults.

Until the new wave of small Winchester disks came on the scene beginning about a year and a half ago, the small-systems hard-disk market was being served primarily by products based on IBM 5440-type removable-cartridge disk technology. Most of these products have the unique characteristic of having 50% of their spindle capacity removable-in other words, they have built-in backup. But the major drawbacks to their use in small systems are relatively low performance (70 ms average access time); relatively high cost per byte; large physical size; and high maintenance costs that get higher as field engineering labor costs grow. Even with the introduction of cost-effective, small, reliable Winchestertype products, these 5440-based products still have a place in some small systems. After all, the backup problem is solved, whereas no generally accepted backup method has yet emerged for the "mini Winnies" to make most customers feel comfortable. It is a problem yet to be solved.

Several approaches are being tried for backup. There are floppy disks, tape cassettes, tape cartridges, reelto-reel tape drives, and, in at least one case, videocassettes.

The ideal characteristics of a backup device are:

- The cost of the modular removable medium should be low (less than \$20).
- The cost of the transport device should be low.
- The data-transfer rate should be similar to the transfer rate of the disk.
- A single removable module should hold more, or at least as

much, data as the fixed disk, preferably an integer multiple of the disk capacity (ie: a 100-megabyte videocassette to back up a 20-megabyte disk).

With the relatively unsophisticated operating-system software present in many small systems today (though this is rapidly changing), the backup strategy is usually to write the entire contents of the disk to a removable backup medium on a daily basis. This procedure results in a significant loss in system availability (while dumping or restoring) unless the backup device has a fast transfer rate and a large capacity.

Perhaps the most appropriate backup for a small Winchester is a device that can be included in the same package, sharing the same spindle drive mechanism and/or some of the same electronics. For the low end this may be a floppy disk; for the high end it can be a cartridge tape drive or a streaming reel-to-reel tape drive. But, except for the very low end where system cost is a prime consideration, a small-capacity, slow floppy disk is not an ideal backup for a large, fast, fixed disk. Streaming tape drives may be good backup devices for high-performance, highcapacity hard disks, but they are too expensive for most personal computer systems. Nevertheless, some streaming tape drives are becoming available. Kennedy Company of Monrovia, California, is delivering (60 to 90 days) its Model 6809 Data Streamer. It is a microprocessorcontrolled reel-to-reel (10.5-inch reels) tape transport with formatter for reading, writing, and controlling the 9-track, 100 ips (inches per second), 1600 character per inch, ANSI- and IBM-compatible halfinch tape drive. It has an unformatted capacity of 46 megabytes per reel. It can transfer 12 megabytes in 75 seconds and 40 megabytes in 250 seconds. It costs about \$2500 in OEM quantities. Data Electronics Inc (DEI), of Pasadena, California, is marketing a 34-megabyte streaming microtape cartridge drive for \$1219 (OEM quantities). Cypher Data Products Inc of San Diego, California, produces a 37-megabyte streaming reel-to-reel tape drive for under \$2000 (OEM quantities). IBM's answer to the backup problem for its 8-inch disk drive is the model 8809 streaming tape drive.

The Products and the Companies

The specifications in tables 3, 4, and 5 speak for themselves. There are a few special features of some of these products worth mentioning. BASF Systems of Bedford, Massachusetts (whose parent corporation, the BASF Group based in Germany, invented magnetic recording tape in 1934), established a Memory Division in early 1979 to manufacture computerdisk drives. Their first product is the 6170 Series 210 mm Fixed-Disk Drives available in 8- and 24-megabyte versions. The 24-megabyte version with the integrated, microprogrammed BASF host-bus interface and controller at \$3900 (single quantity price, substantial discounts available for OEM quantitites) is a cost-effective, high-performance source of reliable data storage for small systems. BASF offers a variety of interfaces. BASF is also a supplier of disk and tape media.

Century Data Systems, a Xerox Company, of Anaheim, California, offers a wide range of disk products for small systems including the 14-inch Marksman model (Winchester technology) with capacities from 10 to 30 megabytes, and the Hunter model with a removable 16.7-megabyte 5440-type cartridge, plus fixed-disk capacity ranging from 16.7 to 83.9 megabytes. Century Data Systems is a long-time manufacturer of computer peripherals. Corvus Systems Inc, San Jose, California, is offering a complete hard-disk subsystem based on the IMI 7710 10-megabyte 8-inch disk. It includes the Z80-based Corvus intelligent disk controller with comprehensive diagnostics and interfaces for TRS-80, Apple II, S-100-bus, and LSI-11 computers. As mentioned above, Corvus also markets a 100-megabyte removable backup in the form of an interface to a standard videocassette recorder using the microprocessor and interface bus of the Corvus disk subsystem. IMI was the first manufacturer to deliver a high-performance 8-inch Winchester drive.

Memorex Corporation of Santa Clara, California, is introducing its first in a planned family of 8-inch hard-disk products, the Model 101. It

offers low cost per megabyte, low weight (10 pounds), low power requirements (56 W), and high reliability. With 11.7 megabytes and 70 ms access time, it is a good example of a product in the low-end segment of the small hard-disk-drive market. Memorex has been manufacturing disk drives since 1967 and has been a major supplier of magnetic media since the company was formed in 1961. The MSC-8000 from Microcomputer Systems Corporation of Sunnyvale, California, is an 8-inch disk drive with built-in removable backup in the form of an 80-mega-

byte half-inch tape drive on the same motor spindle. Micropolis Corporation, of Chatsworth, California, is offering the largest capacity (now available) 8-inch Winchester disk, the Model 1203-I, with 45 megabytes on five surfaces. The density is high (8626 bpi, 478 tpi), the access time fast (42 ms), and the price reasonable. It is another good example of a highcapacity, high-performance 8-inch disk in the high-end segment. New World Computer Company Inc, of Costa Mesa, California, is making an unconventional, miniature hard disk, the Mikro-Disc 211. It is a cross between a high-performance, one-headper-track disk and a cost-effective moving head mini-Winchester drive. It is small, light (8 pounds), and very fast (18.825 ms access time). It has relatively low capacity (2.1 megabytes) but makes up for it in performance, price (less than \$1000 in large OEM quantities), size (91/2 inch by 91/2 inch), weight, and power requirements (less than 50 W). In the words of company president, Phil

Haines, "It's a little screamer." The Mikro-Disc 211 is a versatile storage system suitable for a variety of uses: it can efficiently augment or replace floppy-disk drives, supplement other larger and slower mass-storage devices by acting as a high-speed cache memory, improve system response time by providing fast-access key-directory storage, and be the primary file device in small systems. It has an assembly with twenty proprietary low-cost heads that write and read data onto 0.008-inch-wide tracks. The head assembly is moved only seven 0.010-inch steps (eight positions) across the disk. Each step is accomplished in 5 ms, precisely and accurately, by a low-cost open-loop stepper motor.

The Model 3450 from Priam, San Jose, California, is another example in the high-end segment, along with BASF and Micropolis. It has 34 megabytes on five surfaces, fast transfer rate (1.02 megabytes per second), and high density (6370 bpi, 480 tpi). It is a state-of-the-art product at a reasonable price. The Shugart Associates SA1000-series drives are another example of the low-end segment along with the Memorex 101 with 5- and 11-megabyte models.

Shugart Technology of Scotts Valley, California (a new company not connected with Shugart Associates or Xerox) has just announced its Model ST506 5-inch 6-megabyte Winchester disk drive. It is the size of a 5-inch floppy drive and weighs only 3.5 pounds - 6 megabytes of reliable Winchester disk storage in the palm of your hand for \$925 (OEM quantity 500)! In the popular parlance, this is a hot little product for the small computer system. Evaluation units are scheduled to be available this month and production quantities by next month.

The latest in disk drives for small systems are these 8-inch and 5-inch wonders. The hard disks are upon us, and they're taking personal computing forward by a giant step.■

Quality software for:

Apple II Plus TRS-80 (Level II) North Star

All software is supplied with complete documentation which includes clear explanations and examples. Each program will run with standard terminals (32 characters or wider) and within 16K program memory space. Except where noted, all software is available on PET cassette, North Star diskette (North Star BASIC), TRS-80 cassette (Level II) and Apple cassette (Applesoft BASIC). These programs are also available on PAPER TAPE (Microsoft BASIC).

BRIDGE 2.0

Price: \$17.95 postpaid

An all-inclusive version of this most popular of card games. This program both BIDS and PLAYS either contract or duplicate bridge. Depending on the contract, your computer opponents will either play the offense OR defense. If you bid too high the com-puter will double your contract! BRIDGE 2.0 provides challenging entertainment for advanced players and is an excellent learning tool for the bridge novice.

HEARTS 1.5

Price: \$14.95 postpaid

An exciting and entertaining computer version of this popular card game. Hearts is a trick-oriented game in which the purpose is not to take any hearts or the queen of spades. Play against two computer opponents who are armed with hard-to-beat playing strategies.

FLIGHT SIMULATOR

Price: \$17.95 postpaid

Price: \$14.95 postnaid

(as described in SIMULATION, Volume II) A realistic and extensive mathematical simulation of take-off, flight and landing. The program utilizes aerodynamic equations and the characteristics of a real airfoil. You can practice instrument approaches and navigation using radials and compass headings. The more advanced flyer can also perform loops, half-rolls and similar aerobatic maneuvers.

SIMULATION, Volume II (BYTE Publications): \$6.00

VALDEZ Price: \$14.95 postpaid A simulation of supertanker navigation in the Prince William Sound and Valdez Narrows. The program uses an extensive 256X256 element radar map and employs physical models of ship response and tidal patterns. Chart your own course through ship and iceberg traffic. Any standard terminal may be used for display.

CHESS MASTER Price: \$19.95 postpaid (available for North Star and TRS-80 only) This complete and very powerful program provides five levels of play. It includes castling, en passant captures, and the promotion of pawns. Additionally, the board may be preset before the start of play, permitting the examination of "book" plays. To max-imize execution speed, the program is written in assembly language (by SOFTWARE SPECIALISTS of California). Full graphics are employed in the TRS-80 version, and two widths of alphanumeric display are provided to accommodate North Star users.

FOURIER ANALYZER

Price: \$14.95 postpaid Use this program to examine the frequency spectra of limited duration signals. The program features automatic scaling and plotting of the input data and results. Prac-tical applications include the analysis of complicated patterns in such fields as electronics, communications and business.

TEXT EDITOR I (Letter Writer)

An easy to use, line-oriented text editor which provides variable line widths and simple paragraph indexing. This text editor is ideally suited for composing letters and is quite capable of handling much larger jobs.

MAIL LIST II AIL LIST II Price: \$19.95 postpaid (available for North Star only) This many-featured program now includes full alphabetic and zip code sorting as well as file merging. Entries can be retrieved by user-defined code, client name or Zip Code. The printout format allows the use of standard size address labels. Each diskette can store more than 1000 entries (single density; over 2000 with double density systems)!

STARTREK 3.2 Price: \$9.95 postpaid This is the classic Startrek simulation, but with several new features. For example, the

Klingons now shoot at the Enterprise without warning while also attacking starbases in other quadrants. The Klingons also attack with both light and heavy cruisers and move when shot at! The situation is hectic when the Enterprise is besieged by three heavy cruisers and a starbase S.O.S. is received! The Klingons get even!

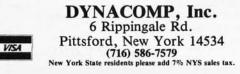

GAMES PACK I and GAMES PACK II Price: \$9.95 each postpaid GAMES PACK I contains BLACKJACK, LUNAR LANDER, CRAPS, HORSERACE, SWITCH and more.

GAMES PACK II contains CRAZY EIGHTS, JOTTO, ACEY-DUCEY, LIFE, WUMPUS and more.

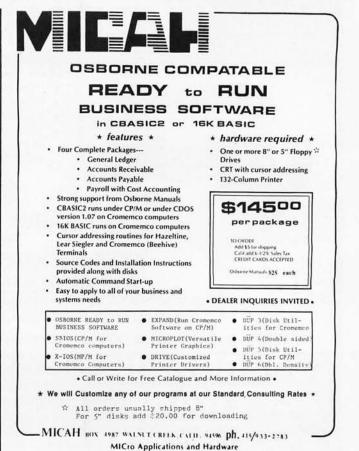

Why pay \$5.95 or more per program when you can buy a DYNACOMP collection for just \$9.95?

Editor's Note

We are particularly pleased to include this article by Dick and Jill Miller in this FORTH theme issue. One of the problems with past BYTE language issues has been the lack of concrete examples of the language being showcased—namely, a full, nontrivial program that does something useful or fun and, at the same time, shows an example of the language at its best.

The program BREAKFORTH, written for the MMSFORTH language running on the Radio Shack TRS-80, does show the language FORTH at its best. This real-time video game, which is a version of the arcade-type game that requires the user to chip away at a "brick wall" by directing a bouncing ball at it with a paddle, is what Dick Miller calls "electronic flypaper"—a game so addictive that it keeps people trapped at their TRS-80, unable to stop playing.

In addition to being playable (quite a testament to the speed of FORTH, especially if you have ever seen the same game written in TRS-80 BASIC), the game also gives an example of how a good FORTH program is put together, as well as how it can be more readable when properly written out with adequate indentation and comments.

Another departure from previous language issues is the availability of the language FORTH at reasonable cost on a wide range of microcomputers (see chart of FORTH sources, elsewhere in this issue). Miller Microcomputer Services (MMS) supplies one of the most complete and well-supported versions of FORTH available, along with a newsletter and other FORTH products available at reasonable prices. (For example, MMS sells a FORTH software package that adds floating-point arithmetic (both singleand double-precision), complex arithmetic, and a full Z80 assembler, all on floppy disk for \$29.95.)

This article was produced with the help of two other people not yet mentioned. The first is Tom Dowling, who wrote the MMSFORTH language for the TRS-80 and who does a large portion of the FORTH programming for MMS. The second person is Arnold Schaeffer, who wrote the BREAKFORTH program as his first FORTH program. If this achievement were not impressive enough, then I should add that Arnold is a high school student. This is proof that FORTH can be learned by anyone with sufficient enthusiasm for the language.

Analyzing the BREAKFORTH program is a great way to learn about FORTH and how to program in it. The program can be typed in as is on a TRS-80 using MMSFORTH's full-screen editor and virtual memory, but I suggest that you first read John James' article in this issue, "What Is FORTH? A Tutorial Introduction," before seriously studying the BREAKFORTH program.

One final note on alteration: this program is meant to work on a TRS-80 Model I running MMSFORTH. Users of other FORTH systems having a graphic display of 48 by 128 resolution or better can probably get the program running by rewriting some words unfamiliar to their system. Some information designed to help in this conversion effort has been supplied in this article....GW

BREAKFORTH Into FORTH!

A Richard Miller and Jill Miller Miller Microcomputer Services 61 Lake Shore Rd Natick MA 01760

About the Authors

A Richard (Dick) and Jill Miller founded Miller Microcomputer Services in 1977 as a consulting firm specializing in support for the Radio Shack TRS-80. After continued dissatisfaction with other languages available for the TRS-80 (FORTRAN, COBOL, Pascal, PILOT, BASIC), they settled on FORTH as a language that combines the seemingly incompatible traits of language complexity, high operating speed, and low memory overhead. They released their first version of MMSFORTH (version 1.5) in June 1979, and have been improving disk and cassette versions of the system ever since. MMSFORTH resembles the FORTH Inc version of the language called microFORTH, and was written independently with permission from that company.

Introduction to BREAKFORTH

This BREAKFORTH program was created by Arnold Schaeffer. The program, which was purchased by MMS, has received minor modifications and is now included with the purchase of MMSFORTH version 1.9 (on a different range of blocks from those shown here, blocks 69 thru 74). We think it is a classic game as is, and fully expect individuals to modify it in accord with their game preferences—for their individual use.

The BREAKFORTH program is a straightforward one, although it is not a trivial one. It combines many of the techniques of FORTH and can be

followed easily with a little time and study. Figure 1 shows a typical BREAKFORTH video display, with an operator-controlled game paddle at the bottom, a bouncing ball, and a barrier to be knocked out one brick at a time by successive bounces until all the bricks have been cleared away. Each removed brick scores one point or more depending on its level, and there is a surprise bonus for a completely cleared barrier. Ball speed and number of balls are selectable, but be warned that, as you bounce your way up to the higher layers, the ball speed increases! You might want to start with short games using five balls and

a ball speed of seven. Fifty balls and a speed of four will present a challenge for high scorers.

BREAKFORTH offers some other features, too. As you and your friends try for better scores, a BEST score is kept to challenge your present effort. In addition, the paddle adds backspin in certain cases that we will leave you to discover.

To add sound, plug an external speaker into the EAR jack of your cassette tape recorder, attach the middle cable from the keyboard unit (not the motor remote cable) to the AUX jack of the tape recorder, and open the tape compartment door. While depressing the write-protect detector switch at the left side of the back of this compartment, simultaneously press the Record and Play keys. This procedure allows the cassette tape recorder to be used as an amplifier. The BREAKFORTH program manipulates the cassette port (normally used for writing a program to tape), causing a sound to be amplified by the recorder and played on the speaker.

Like other brands of electronic flypaper, BREAKFORTH may keep you glued to the keyboard. If you have to leave but do not want to give up the game, press shift-@ to pause the game. Pressing any other key will cause the game to resume where you BREAKFORTH is developed in the FORTH manner, with top-down design and bottom-up programming.

left off. To start a new game in midstream while keeping the BEST score, press the Break key, type in the word BREAKFORTH, and press the Enter (Return) key.

BREAKFORTH is developed in the FORTH manner, with top-down design and bottom-up programming. Figure 2 shows the organization of the program. These modules shown in figure 2, along with the various 1-byte and single-precision (2-byte) variables and constants they invoke, are listed with explanations in table 1, a directory of the BREAKFORTH words that this program will add to the FORTH vocabulary.

The program's source code is on six consecutive blocks, and in this case happens to be located on blocks 50 thru 55; see listing 1. In MMSFORTH, one enters { 50 6 LOADS } to load the program—that is, to compile and execute all the information on blocks 50 thru

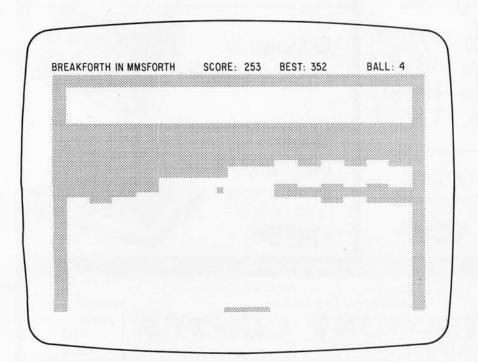

Figure 1: One view of the TRS-80 video screen during a BREAKFORTH game.

55, ending with the immediate execution of the word BREAKFORTH from line 15 of block 55 (which causes the program to be run). (Other versions of FORTH that lack the consecutive-blocks word, LOADS, will have another way of doing this.)

The First Block

Let us take a detailed look at block 50 in listing 1. Lines 0 thru 2 are all comment lines, as are any words surrounded by parentheses. Notice that because FORTH words are set off by spaces on either side, the "begin comment" word, { (} , must be separated from the first word of the comment by at least one space. (Because of the way { (} is defined, the closing parenthesis need not be separated from the last word of the comment by a space.)

Most definitions in FORTH begin with a colon ({ : }) and end with a semicolon ({ ; }), where the first word after the colon is the word being defined. In line 3, the first word defined is TASK . Since the only word following TASK is the closing semicolon, we can conclude that the word TASK does not do much. However, it does serve as a "bookmark," marking the beginning of the words and variables that are specific to this application (game). We will come back to TASK later, at the end of block 55.

Line 3 also causes two other blocks on the MMSFORTH system disk to be loaded into memory. Block 32, when loaded, adds several specialpurpose words having to do with random numbers: RANDOMIZE and RND . Block 33, when loaded, adds several words that have to do with graphics: DCLR, DSET { D? } , ECLR , ESET , and { E? } . (The last three are the same as TRS-80 BASIC words RESET, SET, and POINT, and the variables beginning with D are the same, but referencing double-width characters.)

Lines 4 thru 6 initialize seven double-byte variables and two singlebyte (CVARIABLE) variables. In FORTH, unless specified, all variables, constants, and stack entries are 16 bits (2 bytes) long. See table 1 for the meaning of these variables.

Line 7 defines a new word, LINE, using a colon to begin the definition and a semicolon to end it. Several spaces (usually three) are placed be-

tween the word being defined and the first word of the definition; this adds to the clarity of the definition. PTC (for "put cursor") places the cursor at a given point on the screen, much like the PRINT@ instruction in TRS-80 BASIC. It expects two numbers on the stack, the row (second-to-top) and the column (on top) giving the desired position for the cursor. (For example, [8 32 PTC] puts the cursor near the center of the screen, 8 rows from the top and 32 characters from the left edge of the screen.)

However, our new word LINE expects only one number on the stack because the first thing it does when it is called is to put a zero on top of the stack. So the words { 0 PTC } put the cursor at the beginning of a given line (that is, at position (x,0), where x is the number on top of the stack when LINE is called).

The FORTH word ECHO (EMIT in some other versions of FORTH) is like the PRINT CHR\$ function in BASIC-it outputs the corresponding ASCII character for the number. In this case, { 30 ECHO } outputs a

clear-to-the-end-of-the-line signal on the TRS-80. (By the way, the 30 is the decimal number thirty; although you can change to hexadecimal with the word HEX or to any other numeric base, MMSFORTH assumes decimal numbers unless told otherwise.)

2 CASSOUT

Now we are finally able to say what the word LINE does: the phrase { x LINE } clears line x and leaves the cursor at row x, column 0. [0 PTC] puts the cursor at the beginning of the line, and { 30 ECHO } clears the line with a special character (ASCII decimal 30) and leaves the cursor where it is.

The final word described in block 50, INIT, begins in line 8. Its definition is longer than most words, but its function is not at all mysterious once vou know a few FORTH words. CLS clears the video screen (as in TRS-80 BASIC), [0 LINE] clears line zero, and { " } ({ ". } in some FORTHs) causes the character string until the next quote mark to be printed, just as PRINT " STRING " does in BASIC. The word #IN causes a single-Text continued on page 158

HOW TO START YOUR OWN SYSTEMS HOUSE is a practical step-by-step guide for the EDP professional or small businessman who wants to enter the micro-computer systems business.

Written by the founder of a successful systems house, this fact-filled 220-page manual covers virtually all aspects of starting and operating a small systems company. It is abundant with useful, real-life samples: contracts, proposals, agreements and a complete business plan are included in full, and may be used immediately by the reader.

Proven, field-tested solutions to the many problems facing the small systems house are presented.

Listing 1: The BREAKFORTH program. These six blocks, when loaded into an MMSFORTH system, cause the BREAKFORTH program to compile, execute, and, once finished, erase itself from the system. Tape-based users should omit the last three words in the last block. This program does require that the MMSFORTH words for random numbers (block 32 on the MMSFORTH system disk or cassette) and for TRS-80 graphics (block 33) be available to the FORTH system. If these blocks have already been loaded, delete the two LOAD commands in block 50, line 3. Also, the sequence | A MVI 255 | in lines 10 and 11 of block 51 is the notation FORTH uses for the 8080 assembly-language statement MVI A,255. [To speed up paddle response, you can replace the 3 in block 55, line 8 with a higher value. Personally, I enjoy playing the game at speed level 1, with a 12 replacing the 3....GW]

precision number to be entered from the keyboard and placed on top of the The stack. phrase { 1 MAX } causes the number to be replaced by 1 if the number just entered is smaller. Similarly, the phrase [10 MIN] limits the number on the top of the stack to a value of maximum 10. { 10 U^* } multiplies the number by 10 (U^* is an unsigned singleprecision multiply), and [SPEED C!] stores the value from the top of the stack in the single-byte variable SPEED .

Each of the above phrases contains a number and an operation. Since each operation requires two numbers on the stack, the number entered by #IN is the first number, with the second number always being supplied by the first word of the phrase.

Using the same words as listed above, line 10 again clears line 0, prompts for the number of balls to be used in the game, putting that number on top of the stack with the word #IN.

Line 11 clears the video screen again and sets up the back (top) wall of the BREAKFORTH "court" using a do-loop and double-width graphics. In FORTH, the parameters of the loop go on the stack before the loop is called, so { 64 0 DO } begins the loop, and the word LOOP ends it. The loop will be executed sixty-four times, and the word I puts on top-ofstack the current value of the loop (0, 1, 2, 3, ... ,63); note that I does not take on the limit value of 64. The phrase [3 I DSET] sets a doublewidth character at row 3, (doublewidth) column I; similarly, { 4 I DSET } sets the double-width character on the next row below the first.

Similarly, line 11 sets the right and left walls of the BREAKFORTH court, columns 0 and 1 for the left wall and columns 63 and 64 for the right wall.

The phrase { 191 15616 320 FILL } in line 13 creates the initial wall of bricks by using character code decimal 191 (a whited-out character cell) to fill an area of memory (the video display area of the TRS-80) starting at location 15616 and filling for a total of 320 bytes.

The phrase { 0 SCORE ! } , also in line 13, shows us how we store a

value (0) in a variable (SCORE) by using the *store* operator { ! } . Two points should be mentioned here. First, executing a variable name (like SCORE) causes the *address* of the variable, *not* its value, to be pushed onto the top of the stack. Second, the *store* operator { ! } requires the value to be the second-to-top item in the stack and the address of the variable receiving the new value to be the top item in the stack.

The words in line 14 clear line 0 and print a message on the same line, setting the score to zero but leaving the cursor just after the colon that ends the message.

In line 15, the phrase { BEST ? } causes the value of BEST to be displayed on the screen, and the rest of line 15 completes the message that is shown on line 0 of the screen. Finally, the semicolon on line 15 ends the definition of INIT begun on line 8.

When someone says "Tarbell" there's no doubt what's meant... the cassette interface whose reliability and solid engineering made it an industry standard.

Since that first breakthroughproduct, Don Tarbell has expanded his list of useful, dependable components . . . components to meet your needs of today, and keep you prepared for tomorrow.

Check this partial list of quality components Don Tarbell has ready for you. You're probably ready for them, right now.

• When it comes to RAM memory, Tarbell means reliability. 16K and 32K static memory that offers you easier trouble shooting, and far easier maintenance. Remember that. • Tarbell BASIC brings simplicity and sophistication to your programs. Our BASIC is easier to program, and offers unique commands and statements not found in regular BASICS under any name.

 CP/M® disk operating system is, of course, the standard for software exchange. At Tarbell we provide our own approved CP/M system modified for all Tarbell floppy disk interfaces. Note. We also have MP/M® for those interested in multi user systems.

• The Tarbell VDS line comes as a complete package . . . or, as separate units. For example, the Tarbell mainframe can be ordered with 1 or 2 Shugart or Siemens drives, or no drives. Whichever way you go, you get the reliability of Tarbell tested components.

on Tarbell has ready for you?

• With the Tarbell Double Density floppy disk interface, storage capacity, speed and versatility are greatly increased. Under our DD CP/M, single and double density disks may be intermixed with no penalty. The system automatically determines which is in place.

We also still have our Single Density floppy disk interface. It's specifically designed to operate with many different and unusual drives. Naturally, they're Tarbell tested.

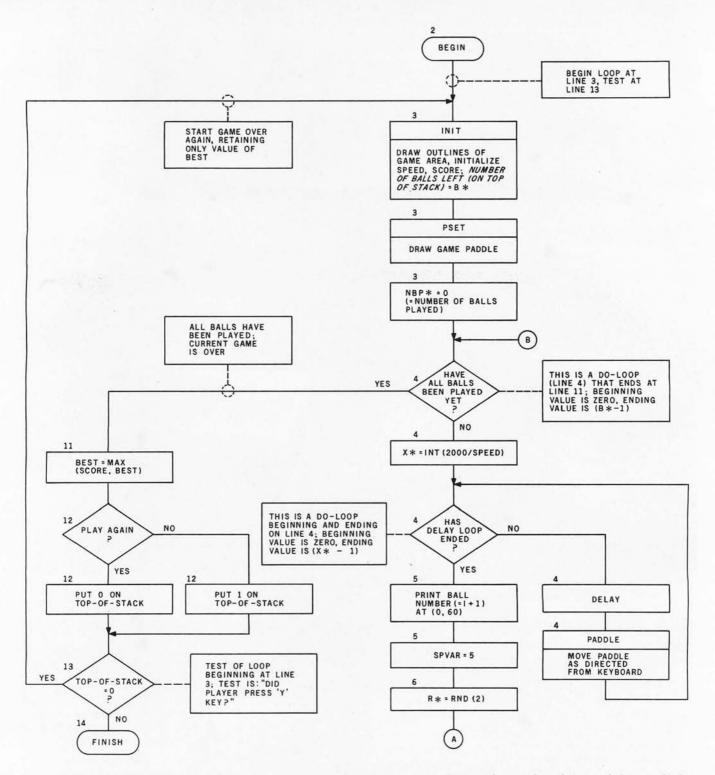

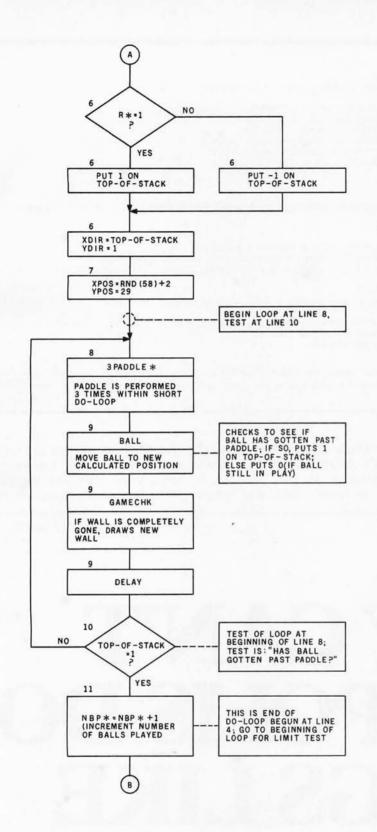

Figure 3: A flowchart for the BREAKFORTH program (given in listing 1, block 55). The number above each box is the line number within block 55 that performs the action of the box. Many calculations in FORTH are done on the stack and do not acquire variable names. Because of this, an asterisk in a variable or procedure name (eg: X^* , 3PADDLE*) denotes that the name was given only in this flowchart to add clarity.

instruction set. Experience with reading and writing FORTH code makes the process easier, but spacing, indentation, use of descriptive word names, and lots of comments are always helpful. A surprise to the BASIC user: none of these sourcecode editing improvements use any extra programmable memory space.

Table 1 explains much of what the words in blocks 51 thru 54 do, but let us look at some of the interesting features contained in these lines of FORTH code. When the ten-to-twenty times speed increase of FORTH over BASIC is not enough (or when we want to do things that cannot be done with existing FORTH words), we can redefine some FORTH words in the assembly language of the computer

(in the case of the TRS-80, 8080 or Z80 assembly language). When we want a FORTH word (program) to run faster, usually a short assembly-language definition of the word that gets used the most will speed things up sufficiently. Lines 10 and 11 of block 51 are the only two words used in BREAKFORTH that are defined in 8080 assembly language.

(MMSFORTH comes with a compact 8080 assembler built in, like many Z80-based FORTHs. A *full* Z80 assembler also is available from MMS at a modest price.)

Inspection of lines 10 and 11 of block 51 shows that assembly-language definitions begin with the word CODE (instead of $\{ : \}$) and end with the word NEXT (instead

of { ; }). Here, FORTH's 8080 assembler is used to define a new type of word to output to a port. Both 1CASSOUT and 2CASSOUT drive the cassette recorder port (I/O port 255 on the TRS-80), and the word BOP executes both these words in a do-loop ten times to create a short square-wave sound on the external speaker.

The definition of PCHK ("paddle check" of ball location) in block 53 uses two more constructs. There are two if constructs, the inner one beginning in line 6 and ending in line 10, the outer beginning in line 5 and ending in line 11. (Notice that only the inner loop uses the optional else clause, as in line 9.) The second construct is a numeric case construct. NCASE : as shown in line 7. When NCASE is executed, it expects the number on top of the stack to be one of the numbers listed between NCASE and the double quote marks (here, zero thru seven). The value found causes the execution of the corresponding FORTH action word in the series of apparent numbers between the double quote mark and the word CASEND. (Numbers are words but not in FORTH's dicare tionary-when they are "executed," they are pushed on top of the stack. MMSFORTH case statements require their action words to be words in the FORTH dictionary and not numeric literals, so in block 53, line 2, 2 and -2 are defined as constants (FORTH words). 1 and -1 are already defined as constants by standard FORTH. Taking [2 CONSTANT 2] as an example, the first 2 is the value of the constant, while the second 2 is the name of the constant; we might have used the word TWO in its place.) In our program, { 0 NCASE } causes -2 to be executed. the word { 1 NCASE } , { 2 NCASE } , or [3 NCASE] cause -1 to be pushed on top of the stack, and so on. Only one of the words is executed; execution then continues with the first word after CASEND . MMSFORTH also has an alphanumeric case statement that branches on the value of a single character. Each may be thought of as a compact, structured, many-branched alternative to a nested series of if statements.

The Last Block

Block 55, the last block used to

Word Name	Usage
SPEED	CVARIABLE contains speed of play.
SPVAR	CVARIABLE contains speed multiplier, depends on height ball reaches.
SCORE	VARIABLE contains current score.
XPOS	VARIABLE contains current ball X position (range, 2 thru 61).
YPOS	VARIABLE contains current ball Y position (range, 5 thru 47).
YDOS	VARIABLE contains current paddle position (range, 2 thru 54).
XDIR	VARIABLE contains current ball X increment (possible values: -2, -1,1,2).
YDIR	VARIABLE contains current ball Y increment (possible values: -1,1).
LINE	Expects <i>n</i> on top of stack; moves cursor to line <i>n</i> , clears line.
INIT	Asks questions and draws display.
PCLR	Clears paddle.
PSET	Draws paddle.
PADDLE	Checks for right- or left-arrow key being pressed and moves paddle appropriately.
1CASSOUT	8080-code procedure for sound.
2CASSOUT	8080-code procedure for sound.
BOP	Makes one bounce noise.
XCHK	Checks if ball hit either side wall, modifies XDIR and XPOS if necessary.
YCHK PCHK	Checks if ball hit top wall and modifies YDIR and YPOS if necessary; also sets speed multiplier. Checks if ball at paddle level; if so, did it hit paddle or is it out of play? Leaves F on top of stack; F = 0 if ball still in play, else 1.
CLR	Clears brick, modifies score and YDIR.
BALLCHK	Increments ball position and checks for wall, paddle, or brick hits. Leaves F on top of stack; F = 0 if ball still in play
BALL GAMECHK DELAY BREAKFORTH	else 1. Clears old ball position, calls BALLCHK, and draws new ball; see BALLCHK for value left on top of stack. Checks if all bricks cleared and draws new barrier if so. Causes a given time delay between ball moves. Main game loop.

define the word BREAKFORTH , defines one last word (DELAY , in line 1), then puts all the words defined so far together to define the word (which is also the program) BREAKFORTH . This is a good demonstration of how FORTH is meant to work: first you define

specialized words that are helpful in solving problems of a given class or application, then you use them to write the specific program needed.

WHY CAN'T MICROPOLIS DO THINGS LIKE EVERYONE ELSE?

(The building words, if chosen and defined properly, can be used to help write other programs in the same class.)

The word BREAKFORTH is defined in lines 2 thru 14. A flowchart for the program is given in figure 3; the number to the left of each box gives the line number within block 55 which the box is associated with.

Line 15, the last line of block 55, is interesting in that it triggers all the work done so far. The word BREAKFORTH causes the definition of the word to be executed. Once the game is finished, the next words, { FORGET TASK } , are executed; these words cause the word TASK (remember block 50?) and every word defined after it to be erased from the vocabulary of the language. This is done to free up the computer once we are finished playing BREAKFORTH. You can omit these words if you wish, but the disk program is recalled into memory so easily (with the phrase | 50 6 LOADS |) that most people prefer to keep the FORTH dictionary as uncluttered as possible. The last word, DIR, causes the standard disk

MMSFORTH directory to be displayed on the screen. (The last three words should be deleted if you are running the cassette version of MMSFORTH.)

Summary

It takes some work to understand your first FORTH program. But this work is only the flip side of the same coin that makes FORTH such a powerful language-where else can you easily write such a large and speedy program in such a small space? [The only other candidate language I can think of is APL, which is also known for its compactness and unreadability to the uninitiated. . . GW] But, of course, your second FORTH program is easier than your first, and so on. Better yet, your second program may be 90% written by your first, thanks to FORTH's structured and modular design.

We hope you have enjoyed this introduction to FORTH. We can assure you that it has just scratched the surface of FORTH, which performs equally well in process control projects and business applications. FORTH improves our programming skills while improving our computer's effective speed, memory capacity, and instruction set. It is a most satisfying language.■

Miller Microcomputer Services offers a number of products and services based on the FORTH language. Version 1.9 of MMSFORTH, the language used in this article, runs on a 16 K-byte or larger TRS-80 Model I with Level II BASIC. The disk version is \$79.95, and the cassette version is \$59.95. Each package contains the complete MMSFORTH system (including a full-screen editor and an 8080 assembler), FORTH source code, documentation, and the microFORTH PRIMER book from FORTH Inc.

To be honest, we could. But our customers have come to expect a lot more from us.

They've come to appreciate our desire to innovate, to improve upon, to blaze new trails in floppy disk technology. That's how we got our reputation as the industry's undisputed technological leader.

96 TPI is nothing new for us.

Consider the current hubbub about "new" 96 TPI disk drives. You should know that what may be new to our competition is anything but new to us.

After all, we brought the 100 TPI MegaFloppy™ disk drive to the marketplace more than two years ago. And we've delivered more than 50,000 drives already.

To us, a 96 TPI drive is no big deal. So for the customer who's looking for a double track drive offering compatibility with 48 TPI drives, Micropolis can deliver.

Think of us as double headquarters.

We should also mention that our double track disk drives give you all the storage capacity of an 8-inch floppy in the body of a 5¼-inch floppy. And with our double head version, you get up to 1.2 megabytes. That's more than ten times the capacity of other 5¼-inch floppies.

But our innovations don't stop there. Over the years, many of our ideas have gone on to become

industry standard. And many more will.

Things like stainless steel, precision-ground lead screws instead of cheaper, less reliable plastic positioners.

We also developed a special disk centering mechanism that is the most accurate in the industry.

And who do you think successfully adapted Group Code Recording technology to the floppy disk drive industry? None other than Micropolis. Remarkable as our technical achievements

may be, some people still wonder how we got to be number two so rapidly in such a fiercely

competitive business. Obviously, we did it by design.

FORTH Extensibility

Or How to Write a Compiler in 25 Words or Less

Kim Harris 1055 Oregon Ave Palo Alto CA 94303

A computer language should help users solve problems. Languages bridge the gap between the primitive operations the computer can perform (add, fetch from memory, etc), and the tasks a user needs (invert a matrix, search a file, etc). When the operations of an application are well matched to those of a language, the solution can be simplified and developed in less time; in addition, the resulting program becomes more readable.

Because all applications have various needs, it is impossible for a nonextensible computer language to satisfy all needs equally well. Although languages have been produced which attempt to include all possible operations, structures, and facilities, these have not been satisfactory.

FORTH's approach is to provide a few techniques that allow a user to quickly add the special operations his particular application requires. The remainder of this article will describe some of these techniques and give examples that add arrays (with and without subscript range checking), virtual arrays, and a case selection control structure.

Extending the Language

The ability to add language facilities and compiler structures is called *extensibility*. FORTH is extensible on three levels of increasing power:

- using existing compilers
- creating new compilers
- creating new operating systems

Editor's Note

In this article, Kim Harris uses the syntax of FORTH-79, which is different from that of existing FORTH implementations, for his examples. FORTH-79 is a standard set of FORTH words that, if used to build all other FORTH words needed for a given application, insures the complete portability of a given program between different versions of FORTH. Members from FORTH Inc, the FORTH Interest Group, the European FORTH Users' Group, and MMS worked together to define FORTH-79. I have noted the differences between the text and existing FORTH implementations (in particular, fig-FORTH and MMSFORTH) where known....GW This article focuses on the second level and demonstrates the construction and use of specialized compilers. The specialized compilers are usually simple (definable in a few source lines), but permit entire new classes of language or compiler facilities to be added to a FORTH system.

The compilation of any computer language is diagrammed in figure 1. Compilation is the process of converting a source language program into a form that a computer can use.

FORTH uses multiple compilers to implement different compiler functions. For example, compiling a data structure declaration (eg: an array) is distinctly different from compiling an executable statement. FORTH uses separate compilers for these two activities. Such compilers are many times simpler than the compilers for most popular languages (eg: BASIC, Pascal, COBOL); however, a collection of FORTH compilers can perform all the functions of the other languages' compilers (when these functions are adapted to a FORTH-like environment).

FORTH uses the English word "word" to mean an executable procedure, not a piece of memory. In this article, "word" will be used in the FORTH sense, and storage sizes will be specified in terms of 8-bit bytes.

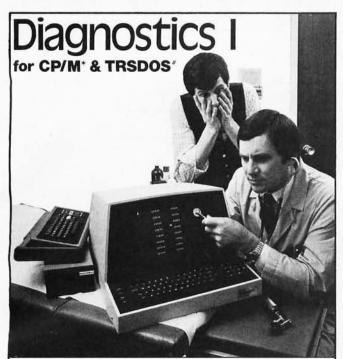

User-Defined Words

The input language to the FORTH compilers is a sequence of FORTH source language word-names separated by spaces. (Unlike other languages, a space in FORTH is very important.) The output is one dictionary definition for each new word (procedure) compiled. The compilation process is controlled by special FORTH procedures called defining words. A source definition, which is a series of FORTH words including defining words, specifies a procedure that can be compiled by executing (typing in) the sequence. The result of compilation is a

Someday your computer is going to break; even the most reliable computer systems "go down". Often, finding exactly what is wrong can account for the most time consuming part of repairing the system, and the longer the system is down, the more money you lose.

DIAGNOSTICS I is a complete program package designed to check every major area of your computer, detect errors, and find the cause of most common computer malfunctions, often before they become serious. For years, large installations have run daily or weekly diagnostic routines as a part of normal system maintenance and check-out procedures.

DIAGNOSTICS I is designed to provide that kind of performance testing for 8080/Z80 micro computers.

DIAGNOSTICS I will really put your system through its paces. Each test is exhaustive and thorough. The tests include:

Memory Test
 - CPU Test (8080/8085/280)
 -Printer Test
 - CRT Test

To our knowledge, this is the first CPU test available for 8080/Z80 CPU's. Many times transient problems, usually blamed on bad memory, are really CPU errors.

A good set of diagnostics is an indispensable addition to your program library even if your system is working fine. Hours have been wasted trying to track down a "program bug" when actually hardware was to blame!

DIAGNOSTICS I also allows you to be confident of your system. This can be critical when file merges or sorts and backups are involved. You want to be as sure of your computer as possible during these critical times. Running DIAGNOSTICS I prior to these and other important functions helps to insure that your system is operating at peak performance.

DIAGNOSTICS I is supplied on discette with a complete users manual.

dictionary definition, which is a block of FORTH-interpretable instructions. All compiled FORTH words are kept in this dictionary, which is usually located in the computer's memory.

User-defined words are treated the same as systemsupplied words. If some new words are defined which behave like operators (eg: triple-precision versions of the FORTH words +, -, *, /, etc), then the language has been truly extended to include these operators. Subsequent words may use these new words as system-supplied operators.

Examples of standard, system-supplied defining words are { : } (colon), which starts the compilation of subroutine-like procedures, and VARIABLE , which compiles a named memory location for the variable's value.

A source definition consists of a defining word followed by the name of the word being defined and then by other FORTH words and numbers. Figure 2 illustrates the source definitions and the corresponding dictionary definitions for two new words named 2* and %INTEREST. (FORTH word-names may be made of *any* nonblank characters.) The word 2* simulates a multiplication by 2 by adding a value to itself.

The defining word { : } compiles the words that follow it in a definition, which is then added to the dictionary. Each FORTH dictionary definition consists of two parts: a *head* and a *body*. The head contains systeminternal information including a *name field* and a *code field*. (A *link*, which points from a definition to a previous definition, is part of the head but will be ignored in this article.) The name field contains the name of the word. The code field contains a pointer to the instructions that will be executed when the word is executed.

For definitions compiled by $\{:\}$, the code field points to a procedure that begins the execution of the words referenced in the definition. The body of this kind of definition, called the *parameter field*, is a series of addresses that point in order to each FORTH word in the definition. The addresses of these referenced words are placed in the parameter field by the $\{:\}$ compiler, and the definition is ended by the FORTH word $\{ ; \}$ (semicolon). The execution of the word EXIT (compiled at the reference to $\{ ; \}$) ends the execution of the word.

Some Examples

The word 2^* will leave a result that is twice the value of its input. (See figure 2a.) Examples in this article will underline the input typed by the user and will end in an unseen carriage return; the computer's response follows. The following line shows the use of the word 2^* :

The use of 2* causes the words in its definition to be executed, as if the user had typed:

3 DUP	two copies of 3 on the stack
+	add both 3s
244	print result from top of stack

Any subsequently compiled word may call the word 2^{*} as if it were any other FORTH word. When called, 2^{*} performs its function and then returns. This is analogous to the execution of a subroutine call in other languages.

A word is called by simply using its name, as in the following source definition for 4^* .

: 4* 2* 2* ;

The defining word { : } has been used to compile another definition into the dictionary.

Using 4^* will cause 2^* to be called and executed twice. Here is an example of the use of the word 4^* .

<u>3 4*</u> . 12 OK

The second word defined in figure 2 uses the defining word VARIABLE to compile a dictionary definition that contains data. The source word-name %INTEREST is compiled into a new dictionary definition containing a

Level

Method

1	Using standard FORTH defining words to add
	new operations (programs).
11	Creating new user-defined defining words that, in
	turn, create new classes of words.
111	Creating new FORTH-like systems through metaFORTH.

Table 1: Levels of extensibility in FORTH. Level I refers to the act of defining ordinary words in FORTH using standard defining words. Level II refers to the creation of new defining words that are then used to create a family of ordinary FORTH words. Level III refers to the act of altering and recompiling FORTH itself (sometimes called metaFORTH) to create significantly different variant FORTH-like systems. Higher levels imply greater capability and flexibility.

2-byte area where the value of the variable will always be stored. (The use of the word-name %INTEREST, either inside or outside a definition, will cause the *address* of this variable's value to be returned, not the value of the variable.)

The dictionary definition for %INTEREST contains the variable's name, a pointer to the instructions executed when %INTEREST is executed, and a 2-byte data area. The code fields of all words defined by VARIABLE point to a procedure which returns the address of the data area of the variable when the variable's name is referenced. All FORTH words, even data words, have some code that is executable.

The two defining words of this figure are actually different compilers. The defining word { : } compiles procedure definitions, while the defining word VARIABLE compiles data definitions. All user-added operators and operands can be used exactly like the system-supplied ones. Even new control structures can be added to the FORTH compiler by the user.

Levels of Extensibility in FORTH

As shown in table 1, there are three levels of extensibility supported by FORTH. The two words defined in figure 2 are examples of extensibility level I, the most commonly used level. It comprises the "ordinary" act of programming in FORTH. Although it is very useful, this level is the most restrictive and the least powerful of the three.

The process of writing and using new defining words is the second level of extensibility. Level II, which is more powerful than level I, allows a new "family" of words to be added to the language or compiler. This is done by creating a special word, called a *defining word*, that will be used to create FORTH words in the same family. The user specifies via the defining word how the compilation of a new family member (itself an ordinary FORTH word) is to be performed and what the result will be. Also the user specifies what a member of the family will do when it is executed.

Level III, the highest level of extensibility, is called *metaFORTH*. It uses the entire FORTH system to compile a collection of source definitions (including both lower levels) in order to produce a clone or a mutation of FORTH.

Take Letteright for quick document preparation and edit plus NAD Name And Address for extensive mailing list capabilities.

Hazeltine 1500

Put them together and you've got a flexible, powerful solution to big and small correspondence problems.

With Letteright you create and edit your document right on the screen. It's much easier to use than a typewriter. The letters are always perfect, and revisions are a snap.

Letteright's "wild card" slots let you create standard letters and forms, then insert information selected from your mailing list to address and "personalize" the letter.

The NAD system will store lots of names and addresses, with identifying information you create. You then print lists, labels, or envelopes

of virtually any group you want from the list, or the whole list.

This pair should be working for every microcomputer owner.

Letteright and NAD are part of a full line of working software solutions from Structured Systems Group, all ready to run on any CP/M® microcomputer system. CP/M is a registered trademark of Digital Research.

(Please don't be misled by my use of the word "compiler." I have been asked, "Can you write a compiler in FORTH that will compile BASIC, Pascal, COBOL...?" The answer is not easy. Defining words *can* compile application-oriented languages, but those languages should be FORTH-like in nature. Ordinarily, the language being compiled satisfies the syntax of FORTH—words separated by spaces. The compilation will result in FORTH-interpretable instructions that will add to its dictionary of word definitions.

In keeping with the FORTH philosophy of keeping all definitions small, defining-word definitions are also small. This results in compilers (defining words) that are simple and specialized, although the range of complexity of these compilers can vary greatly. A simple defining word such as VARIABLE may accept only one source word and produce a single, simple definition in the dictionary. A more complex defining word such as { : } may take several source words and produces a more complex definition.)

The remainder of this article concentrates on level II, defining new families of words. The scope and usefulness of new defining words are discussed using functional descriptions and examples. New defining words can be created which can later compile application-oriented languages.

Creating Families of Words

The technique of creating new defining words permits

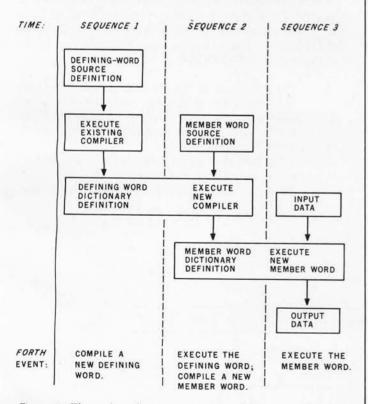

Figure 3: The order of events governing defining words. The first event creates a word that will define a new family of words; this family currently has no members. The second event uses this new family-defining word to create a new family member, a named FORTH word. The third event occurs when any named FORTH word belonging to this family is used.

The Working Analyst.

If you would like to put a computer to work collecting, organizing, and summarizing the information you need to make better decisions, take a look at Analyst. Analyst is a software package designed to let you store and analyze virtually any information involving numbers, dollars, dates, and descriptions. Simply tell Analyst what kind of informa-

tion you want to store. Analyst creates a computerized file for that information. And Analyst creates an information entry program for your file that asks you for each entry, and checks your data for errors. (You can create any number of different files.)

Then tell Analyst what reports you want from your data file. There are all sorts of record selection and report formatting options, so you can design an unlimited variety of reports to focus on different aspects of the same data file.

Analyst is so flexible, you'll find a million ways to use it. It is easy to use, so you don't need

to be a programmer to make your computer really work for you. If this bit of information intrigues you, find out the rest. You'll like what you see.

5204 Claremont Oakland, Ca. 94618 (415) 547-1567 Circle 115 on inquiry card. August 1980 © BYTE Publications Inc 169 a user to later create a family of FORTH words that can have any number of members. Each member shares some family traits but can also have individual characteristics. The family members are all the words that have been compiled by a defining word. Their common traits are specified by the defining word. However, each word in the family has individual characteristics that are assigned when added to the family.

For example, the defining word VARIABLE defines a family with individual members, each of which has a different name and value, but all share the same execution trait: specifically, the use of the name of any variable returns the address of its value.

It is important to understand that there are three timeordered events related to defining words. These are listed in figure 3. These events will be explained using an example.

The compilation of the new words in figure 2 is a sequence 2 event (ie: using a defining word to compile another word). When the defining word VARIABLE is executed, as in:

VARIABLE %INTEREST

the source word %INTEREST is compiled.

Storing a value into the variable is a sequence 3 event.

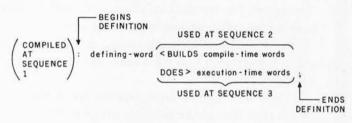

Figure 4: The structure of the source definition of a defining word. These source lines create a defining word for a new family (sequence 1). Execution of the defining word (sequence 2) < BUILDS a dictionary definition for a new family member. The contents of that definition is constructed by the compiletime words. Executing any family member (sequence 3) DOES> (ie: executes) the execution-time words. The following words store a 5 into the variable.

5 %INTEREST !

Since VARIABLE is system-supplied, the sequence 1 event (the compilation of VARIABLE) occurred when the FORTH system was generated.

<BUILDS and DOES>

To illustrate a simple sequence 1 event, a definition of VARIABLE is presented.

: VARIABLE < BUILDS 2 ALLOT DOES> ;

The defining word $\{:\}$ (colon) is used to compile the source definition of VARIABLE. To the word $\{:\}$, VARIABLE is an ordinary definition (level I), and its definition is a sequence 2 event for $\{:\}$. VARIABLE is a defining word because the special words < BUILDS and DOES> are used. (The < and > characters are part of the names of the words; they are used like parentheses to indicate that < BUILDS comes before DOES> .)

As illustrated in figure 4, a defining word specifies both the compile-time behavior (sequence 2) and the execution-time behavior (sequence 3) of all words compiled by this defining word. The sequence 2 behavior is specified by <BUIILDS and any following words up to DOES> . The sequence 3 behavior is specified by DOES> and any following words up to { ; }. The English meaning of <BUILDS is "compiles" and the meaning of DOES> is "executes."

Figure 5 demonstrates what occurs when VARIABLE is executed. The end result of the execution of VARIABLE is that a new dictionary definition is created for the word %INTEREST. The following describes each step in the compilation of %INTEREST :

- The execution of VARIABLE causes < BUILDS to be executed. < BUILDS reads the next wordname after the word VARIABLE from the input text stream. (In this example, the next wordname is %INTEREST .)
- < BUILDS then adds the head of a new definition to the end of the dictionary. Within this head, the name field contains the member's word-name

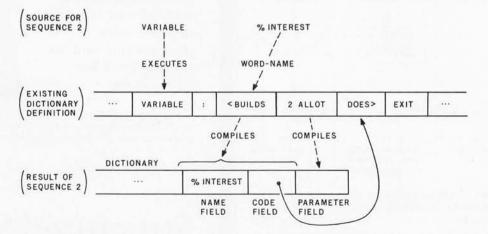

Figure 5: The result of executing a defining word. The first line is executed, resulting in the compilation of the word-name %INTEREST. The result is a new definition in the dictionary.

Now there's a new generation language that can teach your old TRS-80° some new tricks.

A unique growth programming language for the TRS-80* that combines the best features of an interpreter and a compiler all in one functional easy-to-use package.

Introducing TFORTH from Sirius. A new and unique language that cannot be simply compared with FORTRAN or BASIC. TFORTH serves as an operating system, compiler, assembler, interpreter, virtual memory, file system, etc. all in one. Using concepts like virtual memory and stack organization, TFORTH makes easy, efficient, structures, re-entrant programs a natural consequence.

TFORTH is a procedural language specifying a process rather than a desired result. The ability to have the language grow in the direction the user desires is unusual but excellent for novel applications. New data types and new processes can become part of the language. Due to the modular construction, very compact code is produced which, even so, executes at speeds between machine code speeds and about 20% typical overhead. Memory requirements may be "less" than assembler coding or other high level languages.

TFORTH provides an excellent way to develop new languages, or provide simple control of devices including video monitors, A to D converters, burglar alarms and many other tasks requiring monitoring and decision. Many words to handle peripherals are part of basic TFORTH and others may be added easily. Often, substanțial hardware development can be eliminated by using TFORTH to do the major digital logic or reduction of data.

The key to TFORTH's flexibility and ease of use lies in its use of a stack for parameters and a dictionary for WORDS. These WORDS are stated in terms of other WORDS already defined in the dictionary. To execute a "program", the WORD is typed on the console and that WORD is executed.

A rich set of WORDS comes with the basic language, providing IF-THEN-ELSE, DO LOOPS, BEGIN-END, virtual memory, any number base (to base 32) for input or output, a macro assembler, re-entrant code, multithread dictionary, line editor, excellent math package (16 bit integers, Double Precision Floating Point math [standard], SIN, COS, TAN, SQRT, EXP and LOG) and it runs under either TRSDOS* or NEWDOS. Assembler can be nested with high level in an easy fashion. Complicated drivers for new devices take only a few lines of TFORTH! TFORTH from Sirius comes complete for the TRS-80* with as little as 16K of memory and a single Disk Drive using either TRS-DOS or NEWDOS. It is provided on diskettes and an optional Math and Utilities package is available.

TFORTH (on diskette-specify for Standard or 80 Track Drives)....**\$129.95** *TM Tandy Corp.

Among the many supported features of TFORTH are:

- A Macro-Assembler
- Line Editor
- Advanced Math Package
- Re-Entrant Code
- Faster 1/0 Operation
- Super Graphics Capabilities
- High-Speed File Handling ...and much more!

(%INTEREST), and the code field contains a pointer to the instructions that will be executed when %INTEREST is executed (during sequence 3).

- 3. The two words { 2 ALLOT } are executed next. These will reserve 2 bytes of dictionary space for the value of the variable. This space is in the parameter field of the dictionary definition.
- Finally, DOES > terminates the compilation of %INTEREST and links the code field of %INTEREST to the execution-time part of VARIABLE.

When %INTEREST is executed (sequence 3), DOES> is executed, followed by the FORTH words between DOES> and the end of the definition. (In this example, there are no words following DOES> ; the word EXIT is a routine left by the end-of-definition word { ; }.) DOES> returns the memory address of the parameter field within the dictionary definition of %INTEREST. Since the parameter field of a word defined by VARIABLE contains only the value of that word, execution of the word %INTEREST returns the *address* of its value, which is then pushed onto the parameter stack. (That is, in fact, the execution-time behavior of a FORTH variable.)

Figure 6 shows an example of the execution of %INTEREST.

[The above definition and usage of the word VARIABLE are valid for existing FORTHs. However, the definition of VARIABLE supplied with most FORTHs requires the initial value of the variable before the word VARIABLE (eg: { 5 VARIABLE %INTEREST }). This definition of VARIABLE is:

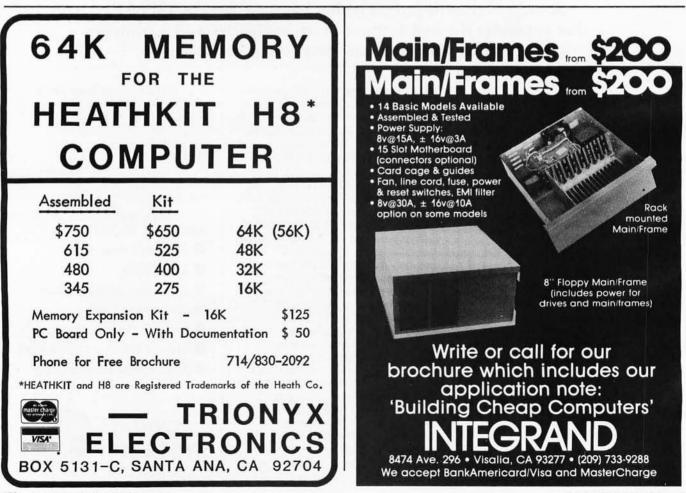

{ : VÁRIABLÉ <BUILDS , DOES> ; }GW]

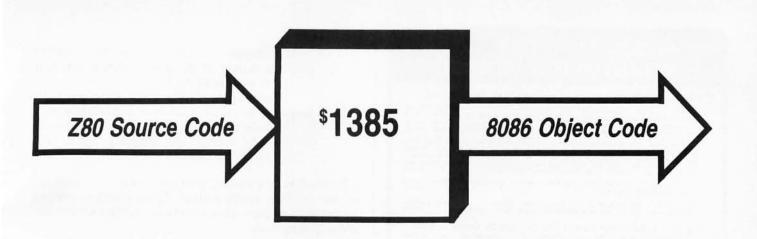

The previous example demonstrated the following principles:

- Sequence 1: the definition of a defining word specifies both the compile-time behavior and execution-time behavior of all words belonging to the family of the defining word (ie: all words created using the defining word).
- Sequence 2: the execution of a defining word causes the compilation of the word-name(s) that follow. This creates a new dictionary

definition and adds a new member word to the family of the given defining word. It also extends FORTH because another userdefined procedure is added to the language.

Sequence 3: the execution of a member word causes the execution of the execution-time words within the defining word that created the member word.

To illustrate the versatility of defining words, examples of new defining words follow. These examples present the creation of new data structures, control structures, and software tools.

Creating a String-Handling Defining Word

To show how defining words can create data structures, a one-dimensional array of 8-bit values will be created. A defining word named STRING will be constructed. After STRING has been compiled, any number of strings may be created; each can have a different name and size. Before the definition for STRING is shown, an example will first be used to describe how STRING will be used.

To create a string 5 bytes long with the name BEANS the following words would be used (BEANS is the name of the string, not the value put into the string):

5 STRING BEANS

This is a sequence 2 event that will create a dictionary definition for BEANS ; this definition will contain 5 bytes of data space for the value of the string.

To fetch or store a character in BEANS, a subscript will be passed to BEANS . BEANS will return the address of the subscripted byte. For example, the words

3 BEANS C@

would fetch character number 3 from BEANS . This is a sequence 3 event because it is a normal use of a word defined by STRING . The subscript precedes BEANS because FORTH prefers to pass data values on a stack.

The definition of STRING can now be written as shown in listing 1. This definition is similar to that of VARIABLE .

The parameter for ALLOT is omitted in this definition; the string size declaration at sequence 2 will supply the size parameter for ALLOT . (The word ALLOT looks for the number of bytes to be reserved to already be on the stack; this is why the string size precedes the word STRING when the string variable BEANS is defined.)

Following DOES > is the word +. This will add the address of the start of the string (supplied by DOES>) to the subscript (supplied to BEANS at sequence 3). Figure 7 illustrates how this works.

Listing 1: A user-defined defining word. The word STRING once defined, can be used to define new FORTH words with unique properties.

When STRING is executed (sequence 2), it builds a dictionary definition for BEANS, which is allotted 5 bytes of data space. When BEANS is executed (sequence 3), it does the addition of the subscript on top of the stack to the address of the first character within BEANS.

The following examples show how BEANS could be used in a FORTH program. The word STUFF-BEANS will store the American Standard Code for Information

Listing 2: Using a FORTH word created by a user-defined defining word. The 5-character string variable BEANS was previously defined with the FORTH statement { 5 STRING BEANS }. Now the word BEANS can be used like any other word in FORTH. In listing 2a, the five characters of BEANS are filled with the letters A thru E. In listing 2b, the characters are printed out. Listing 2c gives the results of executing the words defined in listings 2a and 2b. (The underline denotes user input followed by a carriage return; the computer output, not underlined, follows.)

STUFF-BEANS

OK ABCDE OK Interchange (ASCII) characters A thru E in the string variable BEANS . (See listing 2a.) The word SPILL-BEANS will print the characters in BEANS on the user's terminal. (See listing 2b.) Using these words would produce the results shown in listing 2c.

In a similar way, multidimensional-array defining words may be defined; the size of each element can be any number of bytes.

Since the execution-time function of all family members is specified only once in the definition of the family's defining word, programming time is reduced, memory space is saved, and readability is improved. By changing the definition of the defining word and recompiling the FORTH words using it, the capabilities of every member word are changed. This can be done so that the use of all member words in a user's program is the same.

To illustrate the power of this technique, several variations on STRING will be presented.

Variations on the Defining Word STRING

The original version of STRING did not initialize the contents of the array when it created member arrays. The following version will store blanks in a string when it is created (at sequence 2). It is convenient to first define a word which allocates and blanks dictionary space. The definition of BLANK&ALLOT is a sequence 2 event. (See listing 3a.)

Next, we create a new version of STRING that is the same as the original, except that BLANK&ALLOT is substituted for ALLOT . (See listing 3b.) (The redefinition of STRING is a sequence 1 event.) This version is used exactly like the original, but initialized strings are created automatically.

Another variation of STRING checks if a subscript exceeds the string size when member strings are executed (at sequence 3). If the subscript is less than the string size, the result is the same as before; but, if the subscript is negative or greater than the string size, an error message

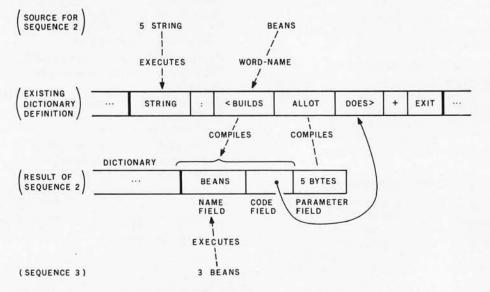

Figure 7: The creation and use of a character array. The defining word STRING is executed, causing the compilation of a dictionary definition for BEANS containing 5 bytes of data space. When BEANS is executed (last line), the DOES> part of the definition of STRING adds the address of the parameter field of BEANS to the subscript (which is 3), returning the address of the desired character within BEANS.

Listing 3: A more sophisticated definition of STRING. The word BLANK&ALLOT (shown in listing 3a) allocates space for and assigns blanks to a newly defined string. The new definition of STRING (shown in listing 3b) uses BLANK&ALLOT to blank out a string when it is created.

Listing 4: Another definition of STRING . This definition stores the size of the string variable when the variable is created and checks for a correct subscript when a character within the string variable is referenced.

THEN	

is produced and the illegal subscript is printed. The string size must be stored in the dictionary definition of member strings when they are compiled (at sequence 2) so that the range check can be made when they are executed (at seauence 3).

A new definition of STRING (a sequence 1 event) that does the subscript checking defined previously is given in listing 4.

The range check slows the execution of every reference to a member string, but such checking may be useful during program development. Since this version and the original version defining STRING are used exactly the same, it is possible to compile this definition of STRING while debugging (then compile all references to it or its member strings). After the program has been debugged, the original version can be compiled (followed by the compilation of all references to it or its members), and the program will run faster.

The next version of STRING allows very large strings to be created and used.

Virtual Strings in FORTH

If the maximum string size exceeds the amount of programmable memory in the computer, the only solution is to write your program using *virtual memory management*. This means that data stored on disk or tape is considered part of the memory of the computer, and that all operations working on these data take care of reading and writing data between main memory and the magnetic storage device.

Using virtual memory management, a program can operate on a string array that is larger than main memory; pieces of the string can be read into memory and written back to disk or tape when required. And, although this technique will slow the execution rate of a program using it, it may be the only way to get a problem solved—and better a slow solution than none at all.

(It is more common to need to manipulate large arrays of numbers rather than strings. Still, the same technique described here can be applied to numeric or any other kind of array.)

With most traditional languages, it would be necessary to rewrite the user program so that all array references would call some function that could perform the disk read operations. Execution time could be decreased if frequently referenced array elements were kept in memory as much as possible. Therefore, it would help if our virtual-memory-array program could keep track of what data is in memory as the program executes.

To show the difficulty of implementing this technique in traditional languages, a FORTRAN example will be used. In standard FORTRAN, the statement: ARRAY(5,7,2) = AR1(1,2) + AR2(10,20,30)

is equivalent to the FORTH words:

In either FORTRAN or FORTH, if the arrays could not fit into memory and were instead on disk, the array references would have to be changed so that some additional procedures read and wrote selected pieces of data between disk and memory. But in FORTRAN, the entire source program would have to be changed. (In FORTH, the body of the program would remain the same; only the appropriate defining word would be changed.)

The following might be the simplest modification possible in standard FORTRAN to do the previous statement using virtual memory management of the arrays:

TEMP=FETCH2(AR1(1,1), 1,2)+FETCH3(AR2(1,1,1), 10,20,30) CALL STORE3(ARRAY(1,1,1), 5,7,2, TEMP)

The functions FETCH2 and FETCH3 are user-written procedures to read the referenced array elements. The subroutine STORE3 is a user-written procedure to write a given value into an assigned array element. If a large program using many normal array references had to be changed to use FETCH and STORE calls, a *lot* of work would be required.

FORTH's separation of control between defining words and their members permits the necessary changes to be made in the definition of the defining word; in this

NEWDOS80

A new enhanced NEWDOS for the TRS-80.

The most powerful Disk Operating System for the TRS-80 designed for the sophisticated user and professional programmer who demancis the ultimate.

NEWDOS/80 is the planned upgrade from NEWDOS 2.1. Some of the features are:

- New BASIC commands for files with variable record lengths up to 4095.
- Mix or match drives. Use 35, 40 or 77 track 5" disk drives or 8" disk drives, or combo.
- Security boot-up for BASIC or machine code application programs.
- New editing commands.
- Enhanced RENUMber that allows relocation.
- · Command chaining.
- Print Spooler.
- DFG function: striking of D, F and G keys allows user to enter a mini-DOS without disturbing program.
- Compatible with NEWDOS & TRSDOS.
- Machine language Superzap/80, 2.1 utilities and enhanced copy by file commands.
- Enter debug any time by pressing 123 keys. Also allows disk I/O.
- Diskette "Purge" command.
- Specifiable system options (limited

APEX

A new disk operating system for the Apple.

Fully Professional DOS for the Apple II. The result of two years of extensive development, APEX provides a complete program development and file management system, both powerful and useable. A comprehensive command set allows the user to perform almost any imaginable disk operation. Here are some of APEX's features:

- · Command structure similar to CPM and main frame systems. Contains 20 command words, with ability to treat external programs as transient commands to the operating system.
- Scrolling editor compatible with Videx 80 char. card.
- Easy program interface. Simple communications between the DOS and user program.
- · Capable of handling 5 inch, 8 inch and hard disks.
- Safety features to protect against accidental data loss. Features include backup files, directory, read-after-write and limit checks.
- 4 times faster than CPM.
- · Auto default structure eliminates tedious typing by automatically setting up command strings, file names, etc.
- Functional on both single and multi-drive systems. Includes ultilities for file copy.
- Device handler structure for interfacing peripherals.

The APEX package includes all of the tools for a complete assembly language development system, high speed two pass resident assembler and a powerful macro editor.

The complete APEX package with operating system, as-sembler, editor and manuals also includes utilities to maintain files on single or multiple drive systems.

way, the program that uses the arrays does not have to be changed.

Furthermore, FORTH's virtual memory facility for disk reading and writing automatically keeps track of what data has been read into memory and tries to keep frequently referenced sections in memory.

Figure 8 illustrates how the array will be read in blocks of 1024 bytes into memory buffers. The new definition for the defining word STRING is given in listing 5.

Adding New Control Structures with Defining Words

The next example illustrates the use of defining words to add control structures to the FORTH compiler. FORTH supplies { IF ... ELSE ... THEN } compiler structures and also loop structures like { DO ... LOOP }, { BEGIN ... UNTIL }, and { BEGIN ... WHILE ... REPEAT } loops.

In this example, we will create a *case* (choose one of n alternatives) selection mechanism. A *case number* will designate one of several words to be executed. Figure 9 presents how a case statement selects one of several procedures for execution. No matter which one is chosen, execution continues with one common procedure that follows the case structure.

The new defining word will be named { CASE: } and can be used similarly to { : }, as the following

Listing 5: Another definition of STRING . This definition creates a virtual string array that stores the string on disk and reads it into main memory when necessary. With this definition of STRING , it is possible to manipulate a string that is larger than main memory without changing the program that uses the long string. The disk operations are transparent—that is, the programmer does not know he is using the disk except for response time.

CompuPro S-100 Motherboards: Designed for the Future,

You won't have to throw away these motherboards when you upgrade your system - they are specifically designed to handle the new generation of 5 to 10 MHz CPUs coming on line, as well as present day 2 and 4 MHz systems. Faraday shielding between all bus signal lines minimizes crosstalk; additionally, when signal lines cross each other on opposite sides of the board, they do so at a 90 degree angle to minimize any chance of stray coupling. You'd expect the company that pioneered active termination to include true active termination, but we've gone one step better by splitting the termination load between each end of every bus line. And you won't have to junk your present computer box with our new motherboards - all sizes fit Godbout, Vector, Imsai, TEI, and similar enclosures.

These high-performance motherboards are available in "unkit" form (edge connectors and termination resistors pre-soldered in place for easy assembly), or fully assembled and ready to go.

NOTE: Most CompuPro boards are available in unkit form (sockets, bypass caps pre-soldered in place), assembled, or qualified under the Certified System Component (CSC) high-reliability program (200 hour burn-in, more). CSC memory boards run at 8 MHz, are guaranteed to run with 6 MHz Z-80s, and draw even less power than standard models.

CAREFUL . . . NOT ALL S-100 CPU BOARDS ARE CREATED EOUAL!

You'll appreciate the extras that go into our CPU boards; take IEEE spec compatibility, for example. While others may claim compatibility, we meet all timing specs - and we'll be glad to send you timing diagrams for our CPUs to prove it (just include an SASE). You don't have to compromise on another "me-too" board ... choose CompuPro.

THE ENHANCED/ADVANCED Z-80A S-100 CPU BOARD

Superior design in an IEEE-compatible board gives the power for future expansion as well as system flexibility. Includes all standard Z-80A features along with power on jump/clear, onboard fully maskable interrupts for interrupt-driven systems, selectable automatic wait state insertion, provision for adding up to 8K of on-board EPROM, 4 MHz operation, and IEEE compatible 16/24 bit extended addressing. **\$225 unkit, \$295 assm, \$395 CSC**.

THE COMPUPRO "RAM" SERIES OF STATIC MEMORY

Recommended for commercial, industrial, and scientific applications. 4/5 MHz standard operation, no dynamic timing problems, meets all IEEE specifications, low power/high speed chips used throughout, extensive bypassing, careful thermal design.

COMING SOON!

We've got a new board coming up that's so versatile some of our people have nicknamed it the "smorgasboard": it includes (among other things) a real-time clock, interval timer, interrupt controllers, and math processor. We've also got a board in the works that greatly enhances the throughput and performance of multi-user (2 or more terminal) systems, by assuming a lot of the overhead functions normally handled by the main CPU. Look for more details on these useful and functional products in the months ahead, or check with finer computer stores for additional information on these and other CompuPro products.

example shows. (In this implementation of the *case* construct, the selection of a case causes the execution of one FORTH word. Since there is no restriction as to the internal complexity of a given word, the selection of one case

Listing 6: Example of a new user-defined programming construct. In listing 6a, we define the words we want to execute when the numbers 0, 1, and 2 are on top of the parameter stack. In listing 6b, the user-defined defining word { CASE: } defines the word ANIMAL, which will execute OPET, 1PET, or 2PET, depending on the value on top of the parameter stack. Listing 6c illustrates what happens when the case-word ANIMAL is executed. See listing 7 for the definition of { CASE: }.

SWAP 2*	(convert case number to) (a byte index)
+ @	(fetch the address of the) (indexed case word)
EXECUTE	(execute the selected word)

can cause any combination of conditional, loop, or case structures to be executed.)

In our example, let us first define three words, OPET, 1PET, and 2PET, that are to be executed when the value on top of the stack is 0, 1, or 2, respectively. This is done in listing 6a. Then we use the { CASE: } defining word (which we will look at later) to define the word ANIMAL (listing 6b). Now that ANIMAL and the case words it uses are defined, calling ANIMAL with the appropriate value on the stack executes the proper case word (listing 6c). For example, pushing a 2 onto the stack and calling ANIMAL causes word 2PET to be executed; this causes the English word COUGAR to be printed.

Since { CASE: } is a defining word, ANIMAL is a member of the { CASE: } family. The definition of ANIMAL consists of a list of addresses for the case words associated with ANIMAL.

The definition of { CASE: } is a sequence 1 event. Listing 7 shows the definition of { CASE: } in FORTH-79. [Listings 8a and 8b show the same definition for fig-FORTH and MMSFORTH, respectively....GW]

Figure 10 shows how the word ANIMAL is built using { CASE: }. The { : } compiler is used to compile the words following ANIMAL. When ANIMAL is

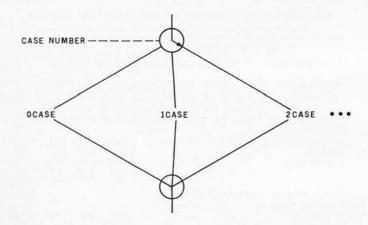

Figure 9: The function of a case control structure. The case number selects one of several procedures for execution, then continues along a single exit path.

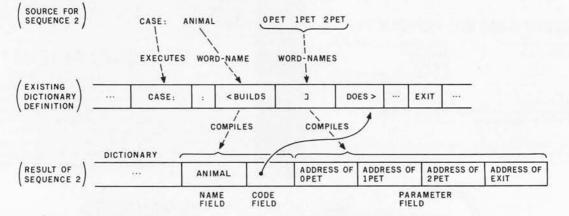

Figure 10: The creation of a case control word. The execution of $\{ CASE: \}$ causes a definition for ANIMAL to be appended to the dictionary. The '|' word uses the $\{ : \}$ compiler to compile the addresses of the case words following ANIMAL.

Listing 9: Definition of a defining word that acts as a programming tool. The word LOADED-BY allows the user to execute (or load) a screen by name rather than by number. For example, if you define { 125 LOADED-BY ACCOUNTING }, executing the word ACCOUNTING will have the same effect as executing the phrase { 125 LOAD }.

executed, the case number that precedes it (which is now on top of the stack) is used just like an array subscript to calculate the address of the case word to be executed. Its compiled address is then fetched and executed.

As with array-defining words, many variations of { CASE: } can be constructed. A case number-range check may be added. An "otherwise" case word can be specified to be executed whenever the case number is out of range.

Defining Words as Programming Tools

The final example applies defining words to the creation of software tools. Such tools are conveniences for the user. Good tools can increase a programmer's productivity, reduce errors, and improve program readability. Defining words can be used to add powerful tools to the FORTH language and operating system.

In FORTH, the word LOAD will compile source definitions from the disk starting at a specified screen number. A *screen* is a block of disk space where source text can be stored using an editor. Additional screens may be loaded if the initial screen contains more LOAD commands.

Application programs and utility programs begin on various screen numbers determined by the user. The defining word LOADED-BY allows words to be defined which will LOAD a screen without calling it by number.

For example, assume a business application starts on screen 125. Then the defining word LOADED-BY can be used to define a word that will load screen 125 when the member word is executed. When we define:

125 LOADED-BY ACCOUNTING

screen 125 will be loaded when the single word AC-COUNTING is executed. (If LOADED-BY looks strange, think of it as a FORTH word like VARIABLE .)

The definition of LOADED-BY is given in listing 9. This definition is similar to the definition of the word CONSTANT except that, rather than returning the value stored in the definition of the member word, LOADED-BY uses that value to provide a parameter to the word LOAD.

Summary

FORTH exploits its own extensibility to support a user's need for a variety of language facilities and compiler structures.

A defining word controls the compilation and execution of all words compiled by it. New defining words that define a new family of capabilities may be constructed. Subsequently, any number of individual members can be added to the family.

The source definitions of most defining words are short and simple. Proper use of defining words in a software development project reduces program development time, improves program readability, and makes program modification and maintenance easier.

Defining words are applicable to data structures, control structures used by the FORTH compiler, and software tools. The ability to create new kinds of defining words (which are, in their own way, small compilers) is a unique feature of FORTH and is one of the most powerful programming tools in the language.

This glossary is a compilation of most of the FORTH words used in the listings and figures of all the FORTH articles in this issue. It does not include all the standard words in FORTH (there are quite a few), nor does it include user-defined words required by each article. The pronunciations of some words are given in parentheses. Wherever possible, an example is given showing the use of the defined word. The words "before" and "after" show the stack before and after the word is executed. In these representations of the stack, the top of the stack is the rightmost number, and the words influenced by the defined word are depicted in boldface.

The columns marked "uses" and "leaves" show how the execution of a FORTH word affects the top entries of the stack. FORTH words remove the stack entries they use and sometimes leave one or more entries on the stack. Therefore, the number under "uses" and "leaves" should equal the number of entries in boldface in the "before" and "after" stacks. Asterisks in both columns mean that the numbers are not given for multiword constructs for the purpose of clarity.

Multiword constructs, like the following example:

{ IF ... ELSE ... THEN }

are enclosed in braces with the keywords separated by ellipses that represent zero or more FORTH words. Also, these constructs are listed only under the first word of the construct. In general, all the words in this table are sorted by ascending ASCII value — for example, the word * (ASCII hexadecimal 2A) is listed before the word + (ASCII hexadecimal 2B).

This glossary assumes that the output device used by the FORTH system is a video terminal. When any definition refers to the video display or display, it actually refers to whatever output device or devices are currently enabled.

FORTH Glossary

Word { ! } (store)	Uses 2	Leaves 0	Notes Sees top-of-stack as address of a 2-byte variable and stores second-on-stack in this variable; for example, suppose that address 20000 points to a 2-byte variable;
			then: before: 9 9 -1150 20000 after: 9 9 (-1150 is stored in a 1-byte variable.)
{ " }	0	0	{ " HI THERE!" }, when executed, prints HI THERE! on the video display.
{ ' } (tic)	0	1	Puts onto top-of-stack the address of the word that follows it.
{(}}	0	0	<pre>{ (THIS IS A COMMENT) } , if included in a definition, will not be compiled; { (} requires a {) } to end the comment.</pre>
*	2	1	Multiplication; example: before: 9 9 3 5 after: 9 9 15 The word * multiplies 5 and 3, leaving 15.
+	2	1	Addition; example: before: 9 9 3 5 after: 9 9 8 The word + adds 5 and 3, leaving 8.
{ , }	1	0	Embeds the number on the top of the stack into a dictionary definition, increment- ing the dictionary pointer.
-	2	1	Subtraction; example: before: 9 9 3 5 after: 9 9 -2 The word — subtracts 5 from 3, leaving -2.
{ . }	1	0	Displays the number on the top of the stack; example: before: 9 9 3 5 after: 9 9 3 (5 is printed on screen.)

YOU KNOW WATSON, HAYDEN SOFTWARE OFFERS THE BEST REASONS TO OWN A MICROCOMPUTER...

I had heard everyone speak about Hayden software. How it was the finest available. "I would be so pleased," said I, "if we could discuss some of their programs."

"Sounds delightful, Watson. This **SARGON II** plays a marvelous game of chess. It has 7 levels of play, and levels 0-3 play in tournament time. It has a randomized opening book for all 7 levels of play through 3 moves. And, a special hint mode is included at all levels of play but 0. Imagine that, old fellow. Small wonder they call it, 'the champ of champs.'"

I then looked around, and spotted a new program. I lifted the cassette, examined it critically, and then began to speak. "This **DATA MANAGER** looks to be as fine a specimen as that **SARGON II**. It stores up to 96,000 alphanumeric characters on just one floppy disk. And one third of this information may be recovered from Random Access Memory at a time. This means, that on just eleven diskettes one can store and retrieve up to 1,000,000 characters. It is, in my judgment, a clever program to have around."

(#04909, Apple II Disk, \$49.95)

"Extraordinary. Here's another program for the Apple II. They call it **APPLESOFT UTILITY PROGRAMS.** It contains 9 subroutines, among them 3 statement formatters: REM, PRINT, and POKE writers. You can calculate the decimal address of your machine language programs, get an exact byte and line count, renumber the program in any increment, and much more. I wonder what other fine programs are to be had from Hayden?" **(#03504, Apple II, \$29.95)**

Holmes leaned back, still puffing at his black pipe. "Wait a minute," said he. "Here's something."

"It's **APPLE**[™] **ASSEMBLY LANGUAGE DEVELOPMENT SYSTEM.** It features a cursorbased editor, global and local labels, and disk-based macros which allow you to incorporate subroutines into any program. And, one can write and modify

machine language programs quickly and easily. It is indeed quite remarkable."

"Quite. But let us not forget **BLACKJACK MASTER**, what. Unlike other blackjack programs that emphasize graphics and harmless fun, this is a serious game. Imagine being able to perform complex simulations and evaluations of any playing and betting strategies that are entered into the microcomputer. And, it will tutor one in how to play these strategies! Good gracious, there's also a **\$250.00 BLACKJACK Challenge!** (#05303, TRS-80 Level II, **\$19.95;** #05308, TRS-80 Disk Version, **\$24.95**)

"What is that ?"

"My dear fellow, just see the package for details! Holmes, you do agree then, that these programs are a fine lot?"

"I'm satisfied, Watson."

"A very sensible reply, Holmes. It's simple to see why one would want to own a microcomputer when Hayden software is available. It's easy-to-use, ready-to-run, comes with full documentation, and can be had at any local computer store."

"Or Watson, you can call **TOLL FREE**, 24 hours a day, (1-800-827-3777, ext. 302)* **TO CHARGE YOUR ORDER TO** Master Charge or Visa! Minimum order is \$10.00; customer pays postage and handling."

"Splendid, Holmes, simply splendid."

Judging by the letters we've received from buyers of Computer Bismarck,[™] home computer historical wargaming is a great mind-stretching recreation to uncramp the old synapses after a few hours of trying to cram 54K of code into 48K of memory. But before you read any further, let us warn you that our *new* game, Computer Ambush,[™] is more gutwrenching than mind-stretching.

Strategy versus Tactics

Computer Bismarck is a "strategic" wargame, casting you in the role of a British or German admiral coolly deploying fleets of ships and planes. Computer Ambush is "tactical"...tough and dirty street fighting in a half-ruined French town.

You're a Sergeant

You command a squad of ten infantrymen (either American or German). Each man has a name, rank, and such individual combat skills as footspeed, strength, intelligence, endurance and marksmanship...all of which affect the success of every move you order. Your squad is armed with grenades, rifles, automatic weapons, plastic explosives, bayonets, and even garottes. You fight with carefully-aimed shots, area bursts, explosions, and hand-to-hand combat. They can result in wounds or deaths, depending on time, distance, the individual skills of each soldier, and your ability as a squad leader.

Battlefield

Street fighting is the most challenging tactical command situation in modern warfare. Using "Higher Text", a character generator, the computer displays a map showing buildings (your plastic explosives can turn them into rubble

during the game), walls, hedges, doors, windows (nasty sniper positions), and each of your men by name. The enemy is usually hidden.

Play the Computer

The computer plays the German squad leader (*Feldwebel* Kurt Reich) to perfection. It defends the town with sniping, machine guns, grenades, and finally, with hand-tohand combat.

You're Sergeant Buck Padooka. You maneuver your men and fire at revealed and probable German positions. If you kill all the Germans before they get you, the town is yours. But the computer's a tough, experienced squad leader, so don't expect to win very often.

Play a Friend You take turns examining the

video map display, moving your men, and firing weapons. Your options are limited by casualties, wounds, physical exhaustion, ammo supplies, terrain, and the individual skills of each of your men. The same is true for your opponent. And every action takes precious time, even the flight of a grenade or bullet. (Remember, time is life or death on the battlefield and in Computer Ambush!) After each turn, the computer displays the movements and weapons fire of both squads as tracks on the video map...just once, so watch carefully to figure out where the enemy is, or was.

The Sweat and Death of War

The time pressure and complexity of Computer Ambush create the stress of actual combat command. Your palms sweat

as you watch PFC Chuck Lawson get blown away by that damned Kraut machine gun you forgot when you ordered him to sneak across the alley. If you can imagine a game that's more complex than chess, requires much faster decision-making, rewards courage and cruelly punishes foolhardiness...that's Computer Ambush!

\$59.95 and an Apple

If you've got an Apple II Plus (or an Apple III or an Apple II with Applesoft Firmware ROM Card) with 48K memory and a 5¼ inch mini-floppy disc drive, you can be playing Computer Ambush in a few days. For \$59.95, you get the game program disc; 2 mapboard charts (for plotting strategies in grease pencil while your opponent is at the computer); 2 squad leader's data cards; and a rule book. You also get a game selection card which tells you how to set

up any of seven wargames: NCO Training, Ambush or Raid against the computer; and Patrol, Ambush, Strongpoint, or Free Form against a human opponent.

Call 800-648-5600 (toll free), and ask Operator 181 to charge Computer Ambush (or Computer Bismarck) to your VISA or MASTER-CHARGE. In Nevada call 800-992-5710. To order by mail, send your check to Strategic Simulations Inc., Dept. B, 450 San Antonio Road, Suite 62, Palo Alto, CA 94306.

With our 14-day money back guarantee, your satisfaction is assured. So come and join our Apple Infantry!

Put your applications to work on the Mostek STD-Z80 BUS.

SMB-80V1.0

You're ready. You've gone beyond the

learning stage and are using your personal computer to implement real time control applications.

We can take you one big step further. By showing you how to take the programs you have developed using your TRS-80 (or other Z80 based computer) and place them in PROM on a low-cost stand-alone micro card system. This will not only free up your main computer for new applications, but will also permit your current application to be "on-line" continuously, or even "cloned"-for multiple installations or sales to other users.

Mostek's MD Series of STD-Z80 BUS compatible microcomputer cards makes all this possible. There are more than twenty different boards in this off-the- shelf family available now, including data processing boards; memory boards (Static and Dynamic RAM, ROM/PROM); I/0 cards; A/D; D/A; high speed floating point math; and floppy disk controller cards.

QC Micro Systems offers all

of these products directly, including a full range of support products such as prototyping hardware, support software and, of course, extensive documentation. And much more. Contact us for details so they can be put to work for you, by sending in the coupon below. Today. QC MicroSystems, P. O.

Н	0	1	2-byte variable containing address of the top of the dictionary; execution of this word causes the <i>address</i> of the variable H (not its value, which equals the address of the top of the dictionary) to be placed on top of the stack.
HERE	0	1	Places the address of the next byte to be used in the dictionary (the <i>value</i> of H) on top of the stack.
Ι	0	1	When executed within a $\{ DO \dots LOOP \}$, the word I pushes onto the top of the stack the value of the index counter; for example, $\{ 10 \ 0 \ DO \ I \ LOOP \}$ prints the numbers from 0 thru 9.
{ IF ELSE THEN }	1	0	Conditional execution of words depending on value of top-of-stack. If nonzero, execute words between IF and ELSE . If zero, execute words between ELSE and THEN ; for example, { IF " NUMBER ON TOP IS NONZERO" ELSE " NUMBER ON TOP IS ZERO" THEN } prints the appropriate message depending on the value on top of the stack.
KEY -	0	1	Gets a single character from the keyboard; for example, if the stack before we press the space bar is: 9 9 3 5
			Then, after we press the space bar (ASCII value decimal 32), the stack is: 9 9 3 5 32
MAX	2	1	Compares the two top entries on the stack and leaves only the larger; example: before: 9 9 3 5 after: 9 9 5
MIN	2	1	Compares the two top entries on the stack and leaves only the smaller; example: before: 9 9 3 5 after: 9 9 3
MINUS	1	1	Changes the sign of the entry on top of the stack; example: before: 9 9 3 5 after: 9 9 3 -5
OVER	2	3	Copies the second-to-top entry onto the top of the stack; example: before: 9 9 3 5 after: 9 9 3 5 3
PAD	0	1	PAD is a 2-byte variable that points to the beginning of a 64-byte area for temporary storage of character strings; execution of this word causes the <i>address</i> of this 2-byte variable to be placed on top of the stack.
SWAP	2	2	Exchanges the two top entries on the stack; example: before: 9 9 3 5 after: 9 9 5 3
U*	2	1	The <i>lower 8 bits</i> of the two top entries on the stack are isolated and multiplied together, leaving their unsigned 16-bit product; example: before: 9 9 3 5 after: 9 9 15
			Each factor will effectively be 255 or less, giving a product that will not overflow in 16 bits.
VARIABLE	1	0	Creates a variable that has the value of top-of-stack; example, before executing the phrase { VARIABLE VAR } , the stack looks like: 9 9 -14017 After the phrase has been executed, the stack looks like:
			and the word VAR , when executed, will place the <i>address</i> of the variable on the stack. (The 2-byte number stored at that address will contain the value -14017 .) Unlike a constant, the value of a variable can be changed using $\{ ! \}$ (store).
{] }	*	*	Resumes compilation of a colon definition.

One small word about computers. Osborne The Leader in Microcomputer Books

The redder in Microcomputer Book

ASSEMBLY LANGUAGE is currently being used by thousands of microcomputer programmers. It provides maximum execution speed and utilization of memory crucial to many applications and system programs, and enables the closest control and monitoring of peripheral devices.

OSBORNE continues to provide Assembly Language Programming texts for every major microprocessor, the Z8000 and 6809 forthcoming. The four previous texts, the 6502, Z80, 6800 and 8080A/8085, have already earned the Osborne Assembly Language Programming series an excellent reputation among educators and programmers alike.

CONTENTS. In each book you'll find over 80 programming examples tailored for use on your microcomputer, with source program, object code, flowcharts and explanatory text, entire instruction set fully explained; assembler conventions; I/O devices and interfacing methods; and how to program the interrupt system.

This July, Osborne will begin a new series of microprocessor texts combining instruction on hardware and logic configurations with usage of assembly language.

The first release will be **The 8086 Book**. A handbook for all 8086 users, this book includes basic 8086 programming information, a thorough analysis of the 8086 instruction set, and detailed hardware and interfacing guides that reveal the full power of the 8086 multiprocessing capabilities. All examples are programmed in Assembly Language, providing the most efficient solutions to many practical problems.

Khachiyan's Algorithm, Part 1: A New Solution to Linear

Programming Problems

G C Berresford, A M Rockett, and J C Stevenson Dept of Mathematics C W Post Center, Long Island University Greenvale NY 11548

Editor's Note:

This two-part article presents some of the most difficult mathematics we have ever published in BYTE, but we believe that the attention given to the Khachiyan algorithm of late warrants a complete and rigorous treatment here. Part 2 will contain a linear programming example and a TRS-80 BASIC program designed to illustrate the algorithm....CM

Khachiyan's Vector Notation

The vector notation used in Khachiyan's paper is different from that used by most Western mathematicians, so a word of explanation is in order. A system of linear equations (or, as in equation (1.1), linear inequalities) can be expressed in the form:

A x = b

where \mathbf{x} is a column vector of the variables \mathbf{x}_1 thru \mathbf{x}_n , \mathbf{b} is a column vector of the coefficients \mathbf{b}_1 thru \mathbf{b}_m (one for each of the m equations in the system), and \mathbf{A} is an m-by-n matrix (m rows, n columns), where each row of the matrix \mathbf{A} contains the coefficient for the corresponding equation. Khachiyan's notation expresses everything in terms of column vectors. In particular, \mathbf{a}_i is a column vector containing the coefficients of the ith equation. But since the coefficient vector must be a row vector in order to be multiplied by the column vector \mathbf{x} , we follow Khachiyan's notation and denote the corresponding row vector as \mathbf{a}_i where the superscript t denotes the transposition of column vector to \mathbf{a}_iGW

The three-column headline "A Soviet Discovery Rocks World of Mathematics" was spread across the bottom of the front page of the *New York Times* for Wednesday, November 7, 1979. In the following weeks, subsequent articles were heralded as "Shazam! A Shortcut for Computers" and "Mathematician Is Obscure No More." Overnight, Leonid Khachiyan became famous as the author of a revolutionary discovery in the field of linear programming.

What has Khachiyan accomplished? All of the articles in the press are based on second- or third-hand reports and interpretations. [In fact, the first New York Times article incorrectly heralded the discovery as a solution to the still-unsolved "traveling salesman" problem....GW] Lynn Steen's article in Science News, "Linear Programming: Solid New Algorithm," (October 6, 1979) and Gina Bari Kolata's article in Science, "Mathematicians Amazed by Russian's Discovery," (November 2, 1979) discuss the basic problem of linear programming and then report on a paper by Peter Gacs and Lazslo Lovasz that discusses Khachiyan's algorithm. The Gacs and Lovasz paper opens with the statement "we have ignored his [Khachiyan's] considerations which concern the precision of real computations ... " and then proceeds to describe a modification of Khachiyan's algorithm, although the differences between the two procedures are never made explicit.

The notation used in this article, although explained in the text, deserves some attention. In particular, the distinction between boldface and italics is an important one. An italicized variable refers to a scalar quantity (eg: $x_1=3$). A variable in boldface refers to a column vector or a matrix. For example, in the equation Ax=b, A is a matrix and x and b are column vectors.

Also, although this article is based on a paper written by Khachiyan, his discovery was not made without the benefit of previous work by other men. Khachiyan's paper is based on earlier work by A Yu Levin, N Z Shor, D B Judin, and A Z Nemirovsky....GW

This article will present a summary of and a commentary on Khachiyan's original paper. A graphic example of how the algorithm works is shown in figure 3. We will show how Khachiyan's method handles linear programming problems and discuss some possible improvements in the computer application of Khachiyan's proposals. We will then turn to the practical question: Is Khachiyan's algorithm capable of immediate computer application? Although our conclusion is a qualified "no," we will discuss a BASIC program (in Part 2 of this article) for the TRS-80 that can be used to gain an appreciation of Khachiyan's achievement.

Khachiyan's Paper

Our discussion of Khachiyan's paper is based on B Seckler's translation of the paper into English. We would like to thank Professor Seckler for making this translation for us. We use Khachiyan's notations in this discussion so that what he did and how he described it will be clear.

Consider the regions of the plane \mathbb{R}^2 shown in figure 1. The region in figure 1a is the intersection of the four halfplanes $x_1 \ge 1$, $x_1 \le 2$, $x_2 \ge 1$, and $x_2 \le 2$. These inequalities may be rewritten in the form:

Since there are points in the plane that satisfy all four inequalities at once, this system of linear inequalities is said to be *consistent*.

In figure 1b, the shaded region on the lower left-hand side is defined by $x_1 \le 1$ and $x_2 \le 1$, while the shaded region on the upper right-hand side is given by $x_1 \ge 2$ and $x_2 \ge 2$. If we combine these inequalities into one system:

we notice that there is no point in the plane that satisfies all four inequalities at once. Such a system of linear inequalities is said to be *inconsistent*.

We shall use the letters a, b, ... to denote column vectors and a' to denote the transposition of the column vector into a row vector. (See text box.) We will write \mathbf{R}^n for the usual *n*-dimensional Euclidean space. [*Readers unfamiliar with vectors and matrices will find descriptions in many engineering mathematics texts.* Advanced Engineering Mathematics by E Kreyszig, Wiley, 1967, 2nd ed, is particularly good....CM]

Using the above notation, we may let $x' = (x_1, x_2)$, $a'_1 = (-1,0)$, $a'_2 = (1,0)$, $a'_3 = (0,-1)$, and $a'_4 = (0,1)$. Then (1.1) may be rewritten in the form:

$$a_i \cdot x \leq b_i$$
 (for $i = 1, 2, 3, 4$)

where $b_1 = -1$, $b_2 = 2$, $b_3 = -1$, and $b_4 = 2$.

As we see from figure 1, such a system of linear inequalities may or may not be consistent. We will consider only inequalities in which all coefficients are integers. This is no loss of generality, since numbers in a computer can be expressed only to a fixed number of decimal places. By multiplying each inequality through by an appropriate power of ten, we may express each inequality in integers alone.

Thus we are led to the following problem. Given a system of linear inequalities:

$$\mathbf{a}_i^* \cdot \mathbf{x} \le b_i \text{ for } i = 1, \dots, m \tag{2}$$

with integral coefficients, is the system consistent or inconsistent?

Advantages of Khachiyan's Algorithm

Khachiyan's algorithm is a procedure for deciding whether the system given in (2) is consistent. In addition, if the system is consistent, it finds the coordinates of a point satisfying all of the inequalities, or it at least determines them within a small margin of error. Furthermore —and this is the "revolutionary" aspect—the method gives at the start a maximum number of steps (each step

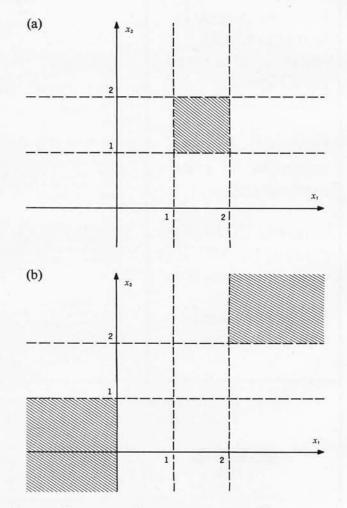

Figure 1: Consistent and inconsistent systems of linear inequalities. The shaded area in figure 1a represents the solution set of the four inequalities, $x_1 \ge 1$, $x_1 \le 2$, $x_2 \ge 1$, $x_2 \le 2$. Since points exist that satisfy all four inequalities, the system is said to be consistent. The system shown in figure 1b is inconsistent. The lower shaded area is given by the equations $x_1 \le 1$ and $x_2 \le 1$; the upper shaded area is given by $x_1 \ge 2$ and $x_2 \ge 2$. No point satisfies all four inequalities simultaneously.

requiring a fixed number of mathematical operations) that will be required to solve the problem. This maximum number of steps increases as the number of variables in the problem increases. With Khachiyan's method, however, the maximum number of steps grows far more slowly than with any other known method, as will be described shortly.

For a system given by (2), let:

i

$$L = \left[\sum_{i=1}^{m} \sum_{j=1}^{n} \log_2(|a_i^j| + 1) + \sum_{i=1}^{m} \log_2(|b_i| + 1) + \log_2 nm \right] + 1$$
(3)

where [x] denotes the greatest integer less than x. This quantity gives a measure of the size of the system (2) of inequalities and an estimate of the number of binary symbols (0 and 1) needed to pose the system for Turing machine solution.

The execution of the algorithm involves $N = 16Ln^2$ iterations. The values computed at each step are required to be accurate to 2^{-37nL} . Notice that as the system of inequalities is made more and more complicated, the number of steps in the algorithm increases as a polynomial in *n*. This means that the problem of determining the consistency of a system of linear inequalities belongs to the class of problems that are solvable in *polynomial time* on deterministic Turing machines. But from a practical viewpoint, it must be noted that the precision required also increases tremendously with the size of the problem.

[The phrase "solvable in polynomial time" means that the time (or amount of computation) necessary to solve the problem is always less than a certain computable amount. The amount is computed by evaluating a function of n, the number of variables in the problem; and when the problem is solvable in polynomial time, the function uses only powers of the function (eg: time $t = K_n^p$ for Khachiyan's algorithm, for some very large value of K and some constant value p). This is an advantage when solving a linear programming problem because existing methods solve the problem in exponential time (a function that uses the term eⁿ), and, for a sufficiently large value of n, a solution in exponential time will take much longer than a solution in polynomial time. To date, the extremely high computation time has made computer solution of very large linear programming problems impossible. The significance of Khachiyan's algorithm being computable in polynomial time is that, on the surface, it opens the possibility of computer solution of these problems....GW]

Details of the Algorithm

The steps of the algorithm involve four quantities: a vector \mathbf{x}_k in \mathbf{R}^n representing the estimate of a solution at the conclusion of the *k*th iteration; an *n*-by-*n* matrix, \mathbf{Q}_k , representing the dimensions of an ellipsoid containing the solutions of the system; the current discrepancy θ_k (\mathbf{x}_k) which measures how far the current estimate \mathbf{x}_k is from being a solution; and the discrepancy of record, Θ_k , which keeps track of the best estimate of a solution found so far by being equal to the smallest θ value encountered within its first *k* values.

The principle of the algorithm is like the traditional method of catching fish in a net: casting the net over such a large region that some of what is wanted must be inside, then gradually decreasing the volume of the net. When the volume is sufficiently reduced, it becomes obvious whether or not anything has been caught.

At the initial step, k = 0, we set:

$$\begin{aligned} \mathbf{x}_{0} &= 0\\ \mathbf{Q}_{0} &= 2^{L} \times \mathbf{I}_{n} \\ \Theta_{0} &= \theta_{0} \left(\mathbf{x}_{0} \right) = \max_{i} \left(b_{i} \right) \\ & i \end{aligned}$$
 (4)

(where I_n is the *n*-by-*n* identity matrix)

The execution of the algorithm at the *k*th step begins by finding the current discrepancy

$$\theta_k(\mathbf{x}_k) = \max_i (\mathbf{a}_i^t \cdot \mathbf{x}_k - b_i)$$

and recording the value of *i* (labeled *i*(*k*)) of the equation giving this maximum value. θ_k measures the discrepancy of the current x_k from being a solution of (2), while *i*(*k*) specifies the index of the inequality that is the worst offender. The discrepancy of record, Θ_{k+1} , is defined as the minimum of Θ_k and $\theta_k(x_k)$.

Finally, a language to meet your needs

The new S-BASIC[™] language has more computing power than any other true compiler BASIC in the industry.

S-BASIC™ is the ONLY CP/M™ compatible BASIC providing . . .

- Chainable .COM programs with parameter passing.
- Dynamically allocated arrays, sequential and random file buffers.
- Dynamically relocatable variables.
- Common, global, and local variables.
- A choice of: While-Do, Repeat-Until, Begin-End, If-Then-Else, and Case-Of Structures.
- Recursive, Multi-lined functions and procedures.
- Memory image disk storage (no conversions)
- CP/M 2 .xx enhancements usage as well as CP/MTM 1.4 x capable.
- 6 data types: Character, string, integer, single and double precision floating point, and packed BCD.
 CP/M is a registered trademark of Digital Research.

Besides all of these unique features, **S-BASIC™** offers long variable names, digit/string line labels (when required), relocatable code output, multiple libraries, external .COM program execution, all of the flexibility of an enhanced BASIC, and a multitude of conveniences that make programming a pleasure.

As a software house always looking for that ideal, powerful, new language . . . we're excited about making **S-BASIC**TM available to the software community.

The algorithm then shifts the center of the ellipsoid net in the "direction" of i(k) and shrinks the ellipsoid to close in on the desired solution. (See figure 3 and the following geometric interpretation of the algorithm in the text.) This is accomplished by setting:

$$\mathbf{x}_{k+1} = \mathbf{x}_{k} + \frac{1}{n+1} \frac{\mathbf{Q}_{k} \cdot \mathbf{F}_{k}}{\|\mathbf{F}_{k}\|}$$
(5)
$$\mathbf{Q}_{k+1} = 2^{1/(8n^{2})} \times \mathbf{Q}_{k} \cdot \operatorname{Ort} (\mathbf{F}_{k}) \cdot \Lambda_{n}$$

where:

- $\mathbf{F}_k = -\mathbf{Q}_k^t \cdot \mathbf{a}_{i(k)}$
- ||F_k|| is the *norm* (or magnitude) of the column vector F_k
- Ort (F_k) is an orthogonal *n*-by-*n* matrix (constructed by the Gram-Schmidt process) with the first column equal to F_k/||F_k|| (remember that, because of its orthogonality, Ort(F_k) is a distance-

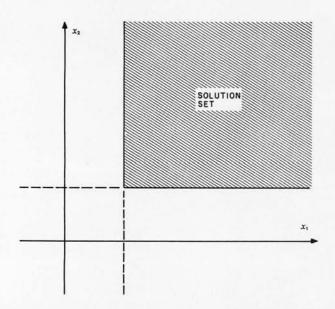

Figure 2: A set of linear inequalities. The shaded area represents the solution set of the two inequalities, $x_1 \ge 1$ and $x_2 \ge 1$. Figure 3 shows how Khachiyan's algorithm solves this system of linear inequalities.

preserving linear transformation)

• Λ_n is the *n*-by-*n* diagonal matrix with diagonal entries $(n/(n+1)), (n/\sqrt{n^2-1}), \dots, (n/\sqrt{n^2-1})$

It is possible to show by induction that the sizes of the quantities in (5) obey the following constraints:

$$\|\mathbf{x}_{k}\| \leq \frac{1}{2} k \ 2^{18L}$$

$$\|\mathbf{Q}_{k}\| \leq 2^{2L+k/n^{2}}$$

$$2^{nL-k/n} \leq \det(\mathbf{Q}_{k}) \leq 2^{nL-k/(4n)}$$
(6)

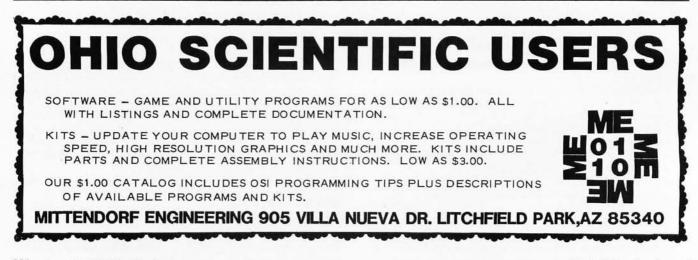

where the norm of matrix \mathbf{Q}_k ($\|\mathbf{Q}_k\|$) is the square root of the sum of the squares of its entries. It is important to note that the point \mathbf{x}_k generated by this algorithm may jump around in a rather random and sometimes extravagant manner, and that it is only the steady contraction of the region (which has a volume equal to det (\mathbf{Q}_k)) that ensures that a solution will ultimately be found.

If $\theta_k(\mathbf{x}_k)$ becomes zero or negative at any step, then \mathbf{x}_k is a solution of the system (2), and the algorithm is terminated. If the algorithm runs through all $N = 16Ln^2$ steps, the discrepancy Θ_{N+1} is calculated and the process ends.

Geometry of the Algorithm

Geometrically, each solution x for the system (2) of inequalities can be considered as a point in *n*-dimensional space, and the aggregate of all such solution points forms a certain volume, the solution set. In Khachiyan's algorithm, each matrix Q_k specifies an ellipse E_k centered at the point x_k according to $E_k = [y: y = x_k + Q_k z, ||z|| \le 1]$. [A less formal description of E_k is as follows: the *n*-dimensional ellipse E_k is the set of points (or column vectors) y that are formed by adding the column vector $Q_k z$ to the current estimate x_k , where z is an arbitrary *n*-dimensional column vector with a length (magnitude) of 1 or less....GW]

The initial choice of x_0 and Q_0 specifies a sphere of radius 2^L centered at the origin. It can be shown that this sphere contains at least a certain minimum volume of solution points, if any exist. The ellipses then change position and shrink, but they always contain at least the prescribed minimum volume of solutions. Khachiyan's observation is that, once the ellipse has shrunk to that

PRIAM **Hard Disks** Now Available from SIRIUS SYSTEMS!

PRIAM's high-performance, low-cost Winchester disc drives speed up throughput and expand data storage from 20 megabytes to 154 megabytes. And a single controller can be used to operate 14-inch-disc drives with capacities of 33, 66, or 154 megabytes or foppy-disc-size drives holding 20 and 34 megabytes. So it's easy to move up in capacity, or reduce package size, without changing important system elements or performance.

SIRIUS SYTEMS offer cases and enclosures for all PRIAM Hard Disk Drives. All 14" Winchester Drives will mount in our 14" Standard Case. The 8" Winchesters have two alternatives: a single drive case and a dual drive case. All SIRIUS SYSTEMS Winchester drive cases include Power Supply, internal cabling, switches, fan, extra AC outlet (not switched, but fused) and possess very adequate ventilation. Drive addressing is done on the rear of the Case and not on the drive iteself to provide ease of use during operation. All WINCHESTER DRIVE Cases are Warranted for a full year and come in our standard blue-black color scheme. Consult us for current availability and pricing.

Introducing the Versatile, Low-Cost **OMEGA Series** Controller

As new technological advances bring down the cost of fast, reliable mass data storage, the need for an inexpensive, versatile controller have be-come greater and greater. To meet this need, SIRIUS SYSTEMS' OMEGA Series Controller was designed

The SIRIUS OMEGA Series Controller Module The SIRIUS OMEGA Series Controller Module utilizes an on-board microprocessor to mediate data transfer to a wide variety of host computer systems. Up to four Winchester Hard Disks (8" or 14"), four 5%" Floppy Disk Drives and/or up to eight 8" Floppy Disk Drives may be in use at one time. Host systems interfacing is accomplished via a parallel or a serial inter-face. With the addition of Personality module, the OMEGA Series Controller Module is directly commatible with many popular comcompatible with many popular com-puter systems (among them the TRS-80*, Apple, Heath, and others). Provision is made for the addition of a streaming tape drive, also.

SPECIFIC HARDWARE FEATURES INCLUDE:

- Control of up to twelve Floppy Disk Drives (eight 8'' and/or four 5¼'') 8'' and/or 5¼'' Disk Drive Utilization
- Single (FM) or Double (MFM) density data
- storage
 Hard or Soft sectored diskette usage

 Accommodates 8" and/or 14" drives of 5.3Mbytes to 154Mbytes
 Utira-fast data transfers
 Extremely flexible host-controller interfacing

SPECIFIC SOFTWARE

- FEATURES INCLUDE: Dynamic format modifications via command
- words

- words Extremely flexible format acceptance for un-usual data storage formats Easily interfaces to standard operating sys-tems (TRS-DOS-, CP/M---, etc) © Operates in either get/put sector mode or data string mode Performance parameters may be changed by EPROM replacement or Dynaminic Repro-oramming gramming

Dedicated systems cards are also available on a limited basis for the STD-BUS and the S 100. These cards feature shared memory also (again, software selectable) in addition to the regular OMEGA Series Controller Module features. Con-sult SIRIUS SYTEMS for current price and availability for the entire line of OMEGA Series Memory Units and Controllers. Dealer inquir-ins are invited. ies are invited.

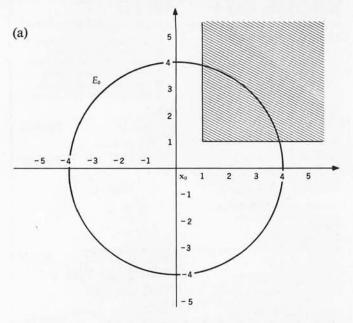

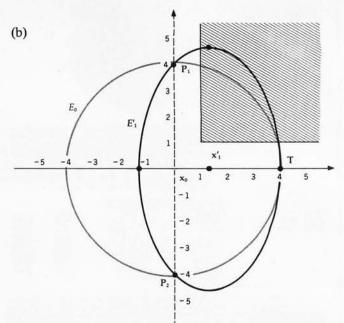

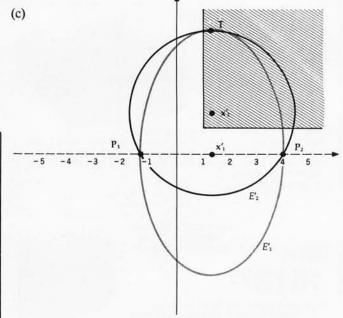

Figure 3: A graphic example of Khachiyan's algorithm. The Khachiyan algorithm (described here for a two-dimensional problem) begins with a circle centered at the origin with a radius of a given size such that the circle is guaranteed to contain the solution points, if they exist. Successive iterations of Khachiyan's algorithm produce ellipses of smaller area that still contain the solution points. Here, the initial circle E_0 is shown in figure 3a. Ellipse E'_1 is then computed from E_0 , as shown in figure 3b, and ellipse E'_2 is computed from E'_1 , as shown in figure 3c. In the last two figures, the current ellipse is shown in black, and the previous ellipse is shown in gray. The shaded area in all three figures describes the inequalities' solution set.

minimum volume (and it does so within $16Ln^2$ steps), it can contain *only* solutions. Thus, either the center x_k is a solution (making the discrepancy ≤ 0), or there were no solutions in the first place, and the system is inconsistent.

To see graphically how the ellipses evolve, we will consider the following simple system of linear inequalities:

$$\begin{array}{rcl} -x_1 \,+\, 0x_2 \,\leq\, -1 \\ 0x_1 \,-\, x_2 \,\,\leq\, -1 \end{array}$$

graphed in figure 2. These are, in fact, the first and third inequalities of system (1.1).

To make the diagrams clearer, we do not take L = 7, as equation (3) would dictate, but L = 2, which we will later show (in Part 2) is permissible. This makes $x_0 = 0$ and $Q_0 = \text{diag}(4,4)$ (a 2-by-2 matrix with 4 in the main diagonal elements, 0 elsewhere). The initial ellipse E_0 is shown in figure 3a.

A complete assembly language course for the 6502 consisting of:

THE TEXT...

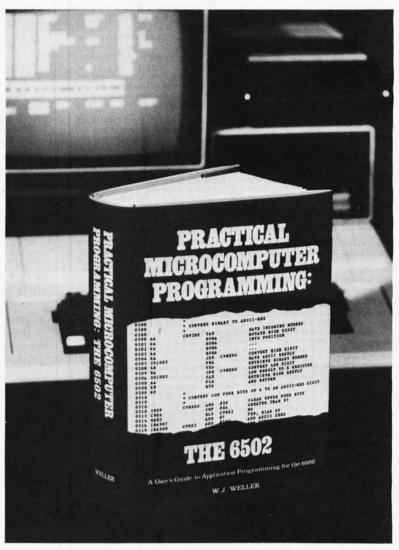

In 20 chapters and more than 100 formal program examples **PRACTICAL MICROCOMPUTER PROGRAM- MING: THE 6502** covers fundamental assembly language techniques as applied to the 6502 with the same thoroughness and attention to detail as its predecessors did for the 8080, 6800 and Z80. The ''difficult'' topics such as interrupts aren't skipped or glossed over but treated in full detail. The example programs address real world programming problems and in many cases can be taken whole from the book for use in application programs. There is no nonsense, no games, just chapter after chapter of solid, accurate programming information. There is nothing else like it available anywhere at any price. If you intend to program the 6502 at assembly level you *need* **PRACTICAL MICRO-COMPUTER PROGRAMMING: THE 6502.**

THE PROGRAMMING SYSTEM...

A complete editor/assembler system which runs directly on the Apple II computer but will run with user supplied I/O on any 6502 based computer with 10K RAM beginning at \$2000. This is an entirely new programming system written specially for this book. It frees the programmer from having to define page zero references at the beginning of the program and contains many pseudo-ops and compound instructions to solve the problems which have made the 6502 difficult to program in the past. Nothing like this system has ever existed for the 6502 before. The full source listing of this system is given in an appendix.

AND MORE SOFTWARE...

A debugging monitor with self restoring breakpoints, filling and searching of memory, direct viewing of stack contents, memory ''windowing'' and many other features. This debugging monitor runs specifically on the Apple II but can be modified to run on other 6502 configurations. If you're tired of inserting and removing BRK instructions by hand this program is for you. The source of the debugging monitor is also included in the book.

AND THE OBJECT IS FREE...

The object of both the editor/assembler and the debugging monitor are sent to book purchasers without charge on either Apple II compatible cassette or paper tape when the licensing agreement at the back of the book is returned. The object code is also available on disk for the Apple II for a nominal charge.

IF YOU NEED TO PROGRAM THE 6502 AT ASSEMBLY LEVEL AND YOU'RE TIRED OF THE "QUICKIES" AND REHASHES OF THE MANUAL, THEN **PRACTICAL MICROCOM-PUTER PROGRAMMING: THE 6502** IS FOR YOU. AT \$32.95 YOU WILL NEVER SEE MORE VALUE FOR THE MONEY.

SORCERER* SOFTWARE!

Unless otherwise noted, all programs are on cassette and require only 8K of memory.

FORTH

new! Now Sorcerer owners can enjoy the convenience and speed of the fascinating FORTH programming language. Based on FIGFORTH and written by James Albanese, this version was designed especially for the Sorcerer and includes the capability to read and write data (screens) to cassette tape and a complete on-screen editor. Requires at least 16K of RAM. \$49,95

new! GRAPHICS ANIMATION by Lee Anders. This package provides the BASIC programmer with a powerful set of commands for graphics and animation. The program is written in machine language but is loaded together with your BASIC program and graphics definitions with a CLOAD command. Any image from a character to a large graphic shape may be plotted, moved, or erased with simple BASIC commands. Encounters of plotted character sets with background characters are detected and background images are preserved. Contains a medium resolution plotting routine. A keyboard routine detects key presses without carriage returns. Includes a separate program for constructing images. \$29.95

new! STARBASE HYPERION[™] by Don Ursem. At last, a true strategic space game for the Sorcerer! Defend a front-line Star Fortress against invasion forces of an alien empire. You create, deploy, and command entire ship squadrons as well as ground defenses in this complex tactical simulation of war in the far future. Written in BASIC and Z-80 code. Full graphics and realtime combat status display. Includes full instructions and STARCOM battle manual. Requires at least 16K of RAM. \$17.95

new! HEAD-ON COLLISIONTM by Lee Anders. You are driving clockwise and a computercontrolled car is driving counter clockwise. The computer's car is trying to hit you head on, but you can avoid a collision by changing lanes and adjusting your speed. At the same time you try to drive over dots and diamonds to score points. Three levels of play, machine language programming, and excellent graphics make this game challenging and exciting for all. At least 16K of RAM is required. \$14.95

new! LUNAR MISSION by Lee Anders. Land your spacecraft softly on the moon by controlling your craft's three propulsion engines. Avoid lunar craters and use your limited fuel sparingly. You can see both a profile view of the spacecraft coming down and a plan view of the landing area. Land successfully and you get to view an animated walk on the moon. Nine levels of play provide a stiff challenge to the most skillful astronaut. Requires at least 16K of RAM. \$14.95

new! HANGMAN/MASTERMIND by Charles Finch. Two traditional games are brought to life by Sorcerer graphics. HANGMAN has three different vocabulary levels for you to choose from. In MASTERMIND, the computer selects a four-character code and you have to uncover it. These two games provide an enjoyable way for young people to develop their vocabulary and their logical reasoning ability. Written in BASIC. \$11.95

QS SMART TERMINAL by Bob Pierce. Convert your Sorcerer to a smart terminal. Used with a modem, this program provides the capability for you to communicate efficiently and save connect time with larger computers and other microcomputers. The program formats incoming data from time-sharing systems such as The Source for the Sorcerer video. Incoming data can be stored (downloaded) into a file in RAM. Files, including programs, may be saved to or loaded from cassette, listed on the video, transmitted out through your modem, or edited with an on-board text editor. Interfaces with BASIC and the Word Processor Pac. \$49.95

DPX^{**} (Development Pac Extension) by Don Ursem. Serious Z80 program developers will find this utility program to be invaluable. Move the line pointer upward. Locate a word or symbol. Change a character string wherever it occurs. Simple commands allow you to jump directly from EDIT to MONITOR or DDT80 modes and automatically set up the I/O you want for listings. Built-in serial driver. Stop and restart listings. Abort assembly with the ESC key. Save backup files on tape at 1200 baud. Load and merge files from tape by file name. Versions for 8K, 16K, 32K, and 48K Sorcerer all on one cassette. Requires the Sorcerer's Development Pac. \$29.95

Khachiyan's algorithm is an approximation of the following geometric construction of the next ellipse E_{k+1} with center x_{k+1} from the known ellipse E_k with center x_k . Since this construction does not give the exact results of the formulas in (5), we will denote the results of our construction by E'_{k+1} and x'_{k+1} .

The ellipse E'_1 is determined from E_0 and x_0 (see figure 3b) as follows:

- Draw a chord through x_0 parallel to the boundary of the inequality most severely violated (indicated previously as having subscript i(k)). This chord cuts the ellipse E_0 at two points, p_1 and p_2 . The solution set of the inequality i(k) will lie on one side, the "solution side," of the chord. (The solution side of the hyperplane can be determined by examination.)
- The new ellipse E'_1 passes through p_1 and p_2 , has its center on the solution side of the chord, and is tangent to the old ellipse E_0 at the point **T**.
- Of the infinite family of ellipses satisfying the above conditions, choose the one with the smallest volume. x₁ is the center of this new ellipse E₁.

The ellipses E'_1 and E'_2 (determined similarly from E'_1) are shown in figures 3b and 3c, each with its predecessor drawn in gray. Note that the ellipses are shrinking, the three having approximate areas of fifty, forty, and thirtytwo square units respectively. The algorithm ended with ellipse E'_2 , since its center x'_2 is in the solution set.

It is important to notice that, while the requirements of tangency and minimal volume in our construction are aesthetically pleasing, they are impossible to achieve in practice. Remember that Khachiyan is concerned with a calculation procedure having only a limited degree of accuracy. If any of the numbers encountered in the execution of the algorithm could not be exactly represented in the computer, the cumulative effect of the resulting roundoff errors could be fatal, particularly in the detection of the inconsistency of a system of inequalities. The paper of Gacs and Lovasz, mentioned previously as ignoring questions of computational precision, presents a modification of the algorithm that computes the tangent ellipses of minimal volume. Thus the Gacs-Lovasz formulas cannot be expected to be successful in any actual computation.

Khachiyan overcomes this difficulty by choosing his ellipses slightly larger than necessary so that, even with his limited accuracy, he can assure that the region he wants is contained in them. The trick here is that if the ellipses are made too large, they will not shrink down on the solutions fast enough. Khachiyan's formulas in (5) for the ellipses achieve the proper balance between the problem of accuracy and the need for a rapidly shrinking series of ellipses.

If you carry out the calculations for the example of figure 2, you will find that, while E'_1 passes through the points $(0, 4)^r$ and $(4, 0)^r$, Khachiyan's ellipse E_1 passes through $(0, 4.12)^r$ and $(4.06, 0)^r$.

Part 2 of this article will discuss a fundamental shortcoming of Khachiyan's algorithm and will include a program in BASIC for the TRS-80.■

THE OASIS **RECIPE FOR QUALITY APPLICATION SOFTWARE.**

appy customers are fast making Single & Multi-User OASIS recognized as the super system software. BUT, system software is only as good as the applications it runs. And that's where OASIS really cooks.

Application software developers particularly like OASIS because it lets them blend unique performance features with their own products-in other words, build better software. Security features like User Accounting with Logon, Password and Privilege Level; File and Automatic Record Locking: Private, Shared and Public Files. Speed and convenience of Keyed Index (ISAM) Files. Economy from Compiled Re-Entrant BASIC that makes multi-user systems practical on as little as 64K memory. And lots more.

Because OASIS has better development tools and more of themcreating very sophisticated software is possible, practical, easier, faster. Just one example: BASIC that is an Interpreter and Compiler with Debugger and Editor. If you do your own development, you'll really appreciate these kinds of features. For software

professionals, they make providing superior products much more cost attractive.

Add all the ingredients together and, whether you do it yourself or buy it off the shelf, the pay-off is a wide selection of topperforming, top-quality application software that does more so you do less.

OASIS; Single or Multi-User with a sizzling array of features and tools; almost unlimited software possibilities (and application software for Single-User OASIS is Multi-User compatible); the most extensive documentation in the industry-indeed, you get a lot to like. And that's put OASIS System Software* among the hottest products on the market.

Construction of a Fourth– Generation Video Terminal, Part 1

Theron Wierenga POB 2007 Holland MI 49423

The construction of this fourthgeneration video terminal is a project that began as a detour from the plans for building a 16-bit microcomputer. I have had a long-standing interest in building an advanced-design video terminal that would have a scrolling feature and a large 2000-character display. It was my desire to have the terminal utilize one of the new programmable video-display-controller integrated circuits, and be a standalone unit with its own microprocessor that would not steal cycles from or otherwise load down the host computer. The number of additional parts that are needed to add the

REAL WOR

microprocessor is quite minimal and, in turn, the microprocessor reduces additional interfacing that would be otherwise needed. The circuitry of this terminal, when wire-wrapped on a single board, could fill one slot in the motherboard of the planned 16-bit microcomputer, or could be used with any other host computer as a stand-alone unit.

Upon receiving a copy of Intel Corporation's *Peripheral Design Handbook* (April 1978 edition), I found a set of plans for just such a terminal. The article is entitled "CRT Terminal Design Using the Intel 8275 and 8279." This circuit and its associated software were the basis for my design. This month, in Part 1, I'll describe the construction up to the point where you can get the 8085 microprocessor operating. Next month, in Part 2, I shall tell about the procedures for assembling the keyboard and video circuitry, putting the control software into operation, and checking out the system. Readers planning to build this terminal should obtain a copy of the Peripheral Design Handbook, as well as the MCS-85 Users Manual, which describes the operation of the 8085 microprocessor. Included in the fiftyseven-page article are detailed design theory, system specifications, system hardware and software design, an explanation of software subroutines, and the original design schematics and data sheets on the Intel peripheral circuits that are utilized in the design. The Intel handbooks are available from Intel Corporation, Literature Department, 3065 Bowers Ave, Santa Clara CA 95051.

Terminal Features

Here are some of the features of this video terminal:

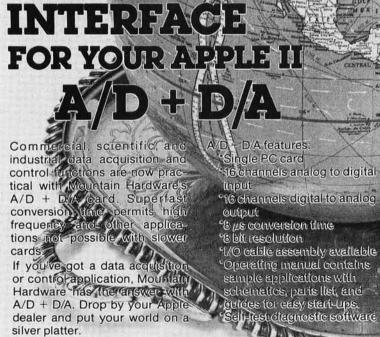

Display format: eighty characters per display row, twenty-five display rows.

Character format: 5-by-7 character contained within a 7-by-10 matrix, first and tenth lines blanked, first and seventh columns blanked, ninth line cursor position, blinking underline cursor.

Character recognized: Displayable characters: sixty-four American Standard Code for Information Interchange (ASCII) uppercase alphanumeric characters,

Control characters: Line feed (control-J), Carriage return (control-M), Back space (control-H), Escape sequences: Cursor up (ESC, A), Cursor down (ESC, B), Cursor right (ESC, C), Cursor left (ESC, D), Clear screen (ESC, E), Home (ESC, H), Erase to end of screen (ESC, J),

Erase line (ESC, K). Characters transmitted: sixty-four

ANNOUNCING COLLECTOR EDITION

FUN AND GAMES

emper 1979

SIGNED AND NUMBERED EDITIONS OF 100. \$15 EACH

Robert Tinney Graphics is now issuing limited editions of selected Byte Covers, each signed and numbered by the artist, Robert Tinney. The first four Collector Edition covers are shown at right. Unlike previously published o SHIPMENT-Collector Edition Byte covers, these magazine-size prints are made from the original Byte color separations, and can be offered at a substantially lower price.

Collector Edition Byte Covers offer the following features:

- THE PRINT—Each Collector Edition Byte Cover is 11"x14", including 11/2" borders at top and sides, and a 134" border at bottom. The paper stock is a smooth finish. 65 lb. antique cover weight. This heavy, very white sheet reproduces the depth and brilliance of the original art.
- THE EDITION—All Collector Editions are strictly limited to 100 prints, and the printing plates are destroyed after the run. Mr. Tinney

inspects and approves the quality of each print before personally affixing the individual number and signature at bottom. A Certificate of Authenticity accompanies each print and certifies the number of the edition as well as the destruction of the printing plates. Each certificate is also signed and numbered by Mr. Tinney.

- prints are packed flat between heavy binder boards to avoid rolling and to assure undamaged shipment. However, should any damage occur, your print will be immediately replaced. Shipment, of course, is always first class.
- PRICE—The price of each Collector Edition Byte Cover is \$15, plus \$3 for postage and handling (\$6 for orders outside the U.S. and Canada). If all 4 covers are ordered, the price is only \$50 plus postage and handlina.

Program memory: 2 K bytes, 2716 erasable programmable read-only memory.

Display/buffer/stack memory: 2 K bytes, 2114 static programmable memory. Data rates: 300, 600, 1200, 2400, 4800 bits per second (bps).

Interface to host computer: 20 mA current loop.

Scrolling capability: Scroll-up feature implemented with 8257 direct-memory-access controller.

The author of the Intel article used an 8080A-based single-board computer, the Intel SDK-80, and an

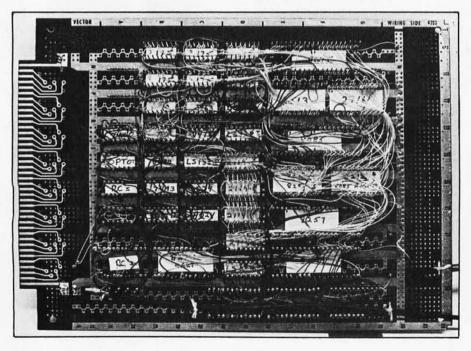

Photo 2: The bottom or wired side of the video terminal board.

SBC-905 prototype board for the additional circuitry needed. I wanted everything to fit on a single board and to run off a single 5 V power supply, so extensive changes were made in my design. The schematic diagram appears in figure 1. The completed unit retains all of the original features plus one or two more.

Hardware Changes

The following are the major hardware changes that were made in my design:

- An 8085 microprocessor was substituted for the 8080A device. Although the parts count is about the same, the 8085 system needs only a single 5 V power supply. The 8085 microprocessor needs an additional 8212 latch for the lower address lines and a 74LS257 multiplexer to produce the control bus. The interfacing to the 8257 directmemory-access controller is somewhat involved; a detailed schematic of this is provided in the *Peripheral Design Handbook* on pages 1 thru 82.
- The additional 8216 buffer from MEMR and MEMW is unnecessary. These signals can be taken directly from the 74LS257.
- A single 74LS138 decoder was used for enabling the peripheral circuitry (ie: the 8251, 8257, 8275, and 8279 devices).
- A 5 V type, 2513 charactergenerator read-only memory was substituted for the 2708. This saves programming the sixty-four 5-by-7 matrices into a 2708-type programmable read-only memory.
- The MD (mode) lines on the two 8212s that buffer the 2114 memory integrated circuits are tied to ground instead of +5 V. This is an error in the Intel schematic.
- Interrupt lines for the 8251 and 8275 are not connected into the 8085. The TRAP interrupt is pulled down to ground through a dual-in-line pin (DIP) switch. Opening this switch pulls up the TRAP interrupt, vectoring the 8085 microprocessor to a small system monitor.
- Video and sync signals were added together through the use of a 7401 open-collector NAND package and a single transistor to form a composite-video output.

Let this New Series from BYTE BOOKS[™] answer your programming questions

Programming Techniques is a series of collected articles concerned with the art and science of computer programming. The first volume in the Programming Techniques series is entitled **Program Design**. The purpose of the book is to provide the personal computer user with the techniques needed to design efficient, effective, maintainable programs.

ISBN 0-07-037825-8 Pages: 96 Price: \$6

Editor: Blaise W. Liffick

Simulation is the second volume in the Programming Techniques series. Both theoretical and practical applications are included. Particularly stressed is simulation of motion, including wave motion and flying objects, and the use of simulation for experimentation.

Text continued from page 212:

- With a system clock of 6.144 MHz, data rates of 300, 600, 1200, 2400, and 4800 bps were generated with a 7490 and 7493 counter. Data-rate selection is through five positions of an eight-position DIP switch.
- A current-loop interface was used, since only a 5 V supply was available. There is also provision for direct access to the universal asynchronous receiver/transmitter

(UART) pins.

- An 8131 comparator was substituted for the 74LS138 used for 2716 decoding.
- Decoding was done somewhat differently for the programmable memory, although the addresses still extend from hexadecimal 8000 to 87FF. These addresses make compatability with the 8257 directmemory-access controller easy.
- Details are given as to how the

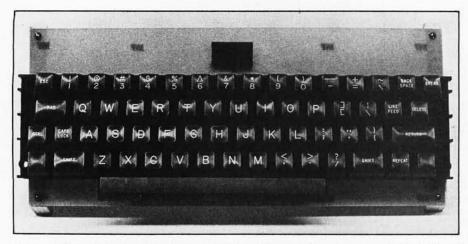

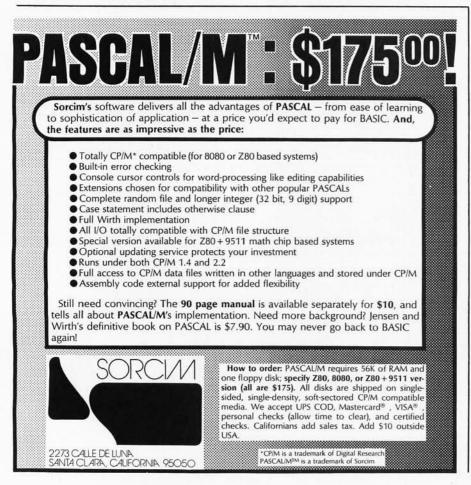

Photo 3: The sixty-three-key Jameco keyboard mounted on its printed-circuit board and installed on support blocks.

keyboard is connected to the system. This is missing in the original article. An inexpensive unencoded keyboard (available from Jameco Electronics) was mounted using a printed-circuit board as well as some wire-wrap connections.

• The video monitor that I used is a 12-inch Motorola unit that takes a composite-video input signal. It was obtained as surplus in used condition. Whatever brand or size is used, it should have a bandwidth of 12 MHz.

Software Changes

A number of changes were made in the software as supplied in the Intel articles. Several minor changes have no direct effect on the program execution, but rather just shorten the code. The major changes are as follows:

- The interrupt vectors at the top of the program were removed. A single vector for the TRAP interrupt was left in. When the TRAP switch is opened, the 8085 microprocessor will transfer control to a small system monitor that can be used for debugging.
- A polling system is used in place of the interrupt system to check the states of three of the peripheral systems. First, the system checks to see if a character has been received by the 8212; second, if the 8275 has requested that the 8257 be reinitialized; and third, if the 8279 has a character to be transmitted from the keyboard. A data rate of 4800 bps is still possible using this polling system.
- The table for character lookup for the keyboard has been changed completely. This was done to comply with the way that I had wired the scan matrix for the unencoded keyboard. A few additional ASCII codes were added that can be transmitted from the video terminal. These codes were for keys on the Jameco keyboard.
- The initialization of the 8251 and 8279 was changed. The values used should work for most systems.
- The 8257 was initialized to Mode 0 because of the change to a standard 2513 character generator.
- A system monitor was added at the bottom of the program which has five commands. The use of the monitor is covered in Part 2 of this article.

16 BIT S100 PROCESSOR

The LDP88 single board computer is the first 16 bit processor to put the power of a 16 bit processor on the 8 bit S100 bus. The LDP88 is IEEE S100 bus compatible ensuring that the user has a large number of compatible board products to choose from. The LDP88 uses the Intel 8088 processor which is fully compatible with the 8086 instruction set.

ANNOUNCING

Lomas Data Products is pleased to announce the availability of the LDP72 floppy disk controller. The LDP72 is also IEEE S100 bus compatible and offers the following advanced features:

Construction

The order in which the sections of this video terminal are built is very important. It is most unusual to put together a project as complex as this without having some sort of problems. Following the order as it is given here will help with some debugging, and hopefully make things go more easily. Do not try to assemble everything and then give it the smoke test.

I chose to connect the electronic parts by wire-wrapping. With the hundreds of connections necessary, it is almost impossible to not make a few wiring errors the first time around. Wire-wrapping allows you

to add or change connections easily if it is necessary. Wire-wrap also allows for a very compact design, which helps to cut down the electrical noise in the system. You should have available an oscilloscope, frequency counter, a general-purpose volt-ohm milliammeter, a wire-wrap gun, 30-gauge wire strippers, and a quantity of 30-gauge wire (as well as the usual pliers, screwdrivers, soldering iron, etc).

A large Vector wire-wrap board (#4350) was used for the circuit, but several other general-purpose wire-wrap boards could also be used. Some individuals may choose one of the S-100 type boards, which would work just as well. Use one that has power and ground planes on it. This makes it easy to distribute the power supply lines to integrated circuits, and provides a good method for installing noise capacitors.

Glue the integrated-circuit wirewrap sockets in place with an epoxytype glue that comes in two components and must be mixed before use. After mixing the adhesive, wait until it starts to thicken considerably before applying it to the sockets. If the integrated-circuit sockets that you use do not have a few small holes in the bottom of the plastic body, make two or three holes with a 1/16-inch drill. This will give the glue something to which it can adhere. Do not use any of the "super glue" types of instant-bonding adhesive, as these are very thin and can bleed into the integrated-circuit socket, plugging up the pin holes and cementing the contacts together. An illustration of the parts layout is shown in figure 3.

Following my own particular order, I first make all connections to the power-supply pins on the integrated circuits. These connections are given in table 1. Connect 5 V to the power-supply bus and check out the voltage at the proper pins of each integrated-circuit socket before installing the integrated circuits themselves. When you do apply power to the circuit, have an ammeter connected to your power supply. High current readings are a quick indication of serious problems. The entire circuit when completed should draw about 1.6 A at 5 V. The usual precautions against static electricity when handling metal-oxide semiconductors (MOS) should be observed for the memory circuits, as

At last...the **Typewriter Interface!**

Turn your electric typewriter into a low cost, high quality hard copy printer. 1 Year Warranty

The patented* RDI-I/O Pak is fast becoming the industry standard for typewriter output. Why? Because:

- 1. It takes 2 minutes to initially install and 5 seconds to remove or
- 2. You do not have to modify your typewriter. All factory warranties and maintenance agreements on your typewriter will be honored.
- You can use it with all powered carriage return typewriters that have U.S. keyboard. Our Model I works with all *non* Selectrics and our Model II works with Selectrics. Conversion between models takes 2 minutes and the kit (26 plungers) is available for a nominal
- 4. You don't have to lug around a bulky printer when you travel. If there is a typewriter at your destination, you can install the light (3 lbs.) I/O Pak in just 2 minutes.
 5. Same interface for TRS-80, Apple and GPIB. Centronics and Pet compatible interfaces are available in third quarter 1980. Electric constitution.

Delivery: stock to 2 weeks. Price: \$499.00, FOB Rochester, Do-

Put your computer in touch with the world. AJ makes it possible for only \$185 with the A 242 acoustic data coupler.

Experts call it "the best acoustic coupler ever made?' Reliability is phenomenal-historically over 35,000 hours mean time between failure! Thousands are in use by companies all over the U.S.

And now, the A 242 from AJ, refurbished at the factory, can connect to your terminal or personal computer, putting you in touch with every other compatible terminal or computer. If you can telephone the site, you can send and receive data.

Bell 103/113 compatible, the originatemode A 242 features quartz crystal control, RS 232 or TTY terminal interface, and operational speeds up to 450 bps. At just \$185-about half the original price-it's a tremendous bargain. And you can have even greater savings with purchases of 10 or more units.

The A 242 carries our standard 30-day parts and labor warranty, and we're offering a no-risk, 10-day money-back guarantee?

well as all of the 8000-series Intel circuits.

Next, make a photocopy of the entire schematic diagram. As you begin to wrap connections, use a red pen to trace each connection made on the schematic. This simple method eliminates the need for a wiring table, but establishes a complete bookkeeping system that indicates which connections are installed or incomplete.

It is helpful to use as many different colors of wire as possible. The address bus can be done in one color, the data bus in another, powersupply lines can be red for +5 V and black for ground, and so forth. This is a great help when you have to trace down wires to check connections. Take the time to cut each wire to the exact length needed. Do not make wires any longer than necessary. Route wires neatly in between the wire-wrap sockets, and try to keep the interior portion of the socket area free from bundles of wires. A neat board is much easier to troubleshoot than the "rat's nest" variety.

The few resistors and capacitors that are needed can be mounted on

one 16-pin and one 24-pin header plug. The 22.68 MHz crystal and 2N3710 transistor can also be mounted on the 24-pin header plug. The 6.144 MHz crystal with its two 20 pF capacitors is mounted next to the 8085 with Vector T-49 Klipwrap pins.

Getting the 8085

Microprocessor Operating

The first integrated circuits to install are the 8085 (IC1), 8212 (IC2, low address latch for the 8085). 74LS257 (IC28), 8131 (IC35), 2716 (IC34), 8251 (IC7), 74LS138 (IC18, peripheral decoder), 7490 (IC16), 7493 (IC17), the eight-position DIP switch, and IC11 (the 7400 NAND package that contains a gate to buffer the clock output of the 8085). All of the connections should be made to these devices. Program the 2716 readonly memory with the 22-byte checkout program that is given in listing 1. Temporarily ground the HOLD input to the 8085 (pin 39) and three of the inputs that are normally driven by the AEN output (pin 9) of the 8257. These inputs are at pin 4 of IC18 (the 74LS138 peripheral decoder), pin 1 of IC2 (the 8212 latch that holds the low address lines from the 8085), and pin 15 of IC28 (the 74LS257).

After you reset the 8085 microprocessor, the simple test program should send out continuous ASCII "U" characters from the 8251 transmitter data output (pin 19). With the 300 bps switch closed, pin 19 of the 8251 should produce a square wave at 150 Hz, which is 300 bps. The IOW line (pin 12 of the 74LS257) should show 30 Hz on a frequency counter. The negative pulses on IOW are very narrow and may not show up on an inexpensive oscilloscope. If you have these signals present, your 8085 microprocessor and its associated circuitry are working correctly.

Do not go beyond this point in construction until your 8085 microprocessor is functioning correctly. If you have problems, check the following items. Make sure that the clock output of the 8085 is 3.072 MHz, and that this signal is getting to

Introducing the Ultimate Personal Timeshare Network and the Star Modem

Now Available for Pet IEEE and RS232C Ports

Now for the first time ever you can get the Star Modem by Livermore and the nation's most sophisticated new time sharing service, Compuserve, in an introductory package at an unbelievable price.

Imagine access to an ever increasing world of database, investment, financial, and Wall Street information, a daily newspaper, plus U.P.I. and A.P. news, and games. Plus electronic mail which allows instant personal message transmission to users nationwide from a proven industrial timesharing network. A tremendous capability increase for just \$5 per hour of usage.

The Star Modem, the market's most sophisticated acoustic coupler, is compatible with standard RS232C

ports. An exclusive triple seal within the cups locks your phone into the acoustic chamber with a vacuum seal to prevent distortion. Includes full answer, originate and test modes with full and half duplex operation. Quality guaranteed as proven by Livermore's unequalled two year warranty.

DWS marketing international, a leader in electronic marketing since 1975, now offers this introductory package of the Star Modem, adaptor and the Compuserve hookup, (order product #320), for only \$189.95. Star IEEE modem, adaptor and hookup, (order product #330), only \$269.95. Optional

10' cables are available for \$24.95 (order product #280). Quantities are limited so order today. Charge customers, to order only, call our toll free number 24 hours a day or send your check but please allow time for checks to clear. VISA. Mastercharge or American Express cards are accepted. Add \$5.00 for insured postage and handling. California residents add 6% sales tax.

Text continued from page 220:

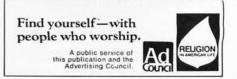

pin 20 of the 8251. Check the TxC and RxC inputs of the 8251 (pins 9 and 25). The frequency on these inputs should be sixty-four times the desired data rate (ie: for 300 bps it should be 19,200 Hz). If this frequency is not correct, check the connections on the 7490 and 7493, as well as the data rate switch. The ALE line (pin 30 on the 8085) should have a frequency of about 650.8 kHz on it. There should be no activity on the MEMW line (pin 9 of the 74LS257). The IOR line (pin 7 of the 74LS257) should have a frequency of about 92.2 kHz. The frequencies listed above should all be read with a frequency counter that uses a full 1-second count period, since the pulses on many of these lines do not have a constant duty cycle. Erroneous readings can result from count periods shorter than one

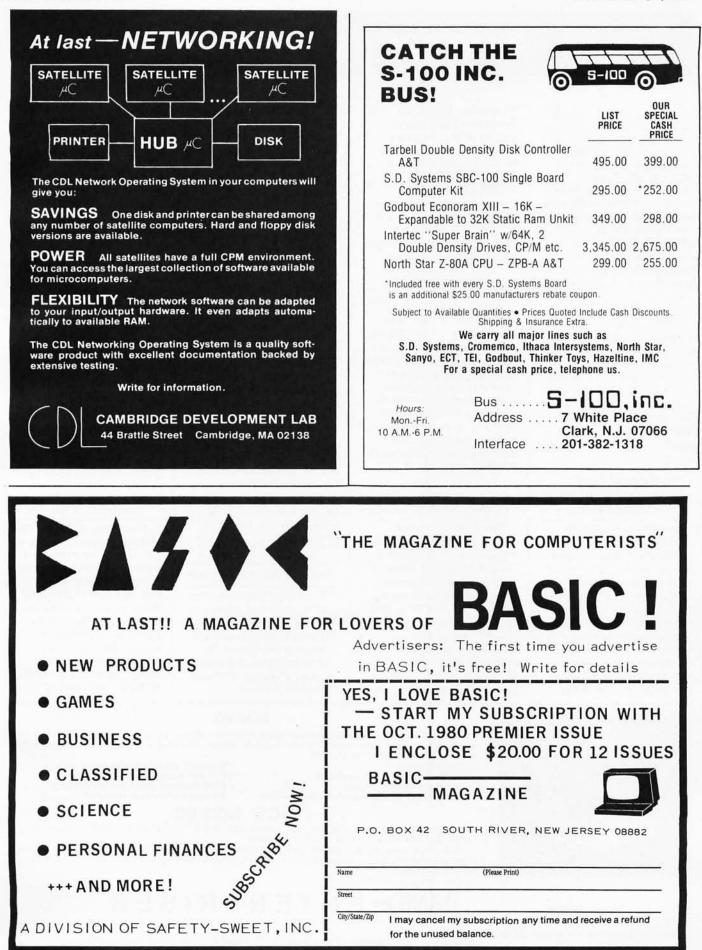

second.

Until next month's BYTE arrives, you will have plenty of time to check the construction of this portion of the circuit. Then, in Part 2, we can proceed with the rest of the project.■

Clubs and Newsletters

Lifelines from Lifeboat

The primary objective of Lifelines is to keep readers informed of the current status of all CP/Mcompatible software. Issues include statistics on the wide variety of CP/M-compatible software products distributed by Lifeboat Associates. In addition there will be three sections dealing with changes, bugs, and new products. Letters from users are featured. The newsletter recently published a Pascal review and an article on undocumented Z80 op codes. The subscription rate is \$18 for twelve issues in the US, Canada and Mexico. Elsewhere the rate is \$40. Write Lifelines, 1651 Third Ave, New York NY 10028.

International Computer Chess Association Shifts Headquarters

In order to handle the growing membership more effectively, the headquarters for the International Computer Chess Association (ICCA) has been transferred from Northwestern University in Evanston, Illinois, to Bell Telephone Laboratories in Murray Hill, New Jersey. All inquiries and membership applications should be sent to ICCA, c/o of Ken

Editorial material for the newsletter should be sent to B Mittman, *ICCA Newsletter*, Vogelback Computing Center, Northwestern University, Evanston IL 60201. Membership dues are \$10. Back issues of the newsletter are \$2 for a set of three.

Another Club in Florida

The Level II Club is an organization where TRS-80 owners can exchange software. The group has a large program library and will soon offer an ads section and programming contests. There are no membership fees. For more information, write Level II Club, 3713 Bay-to-Bay Blvd, Tampa FL 33609.

FORTH Interest Group

The FORTH Interest Group meets on the fourth Saturday of each month in the Special Events Room of Liberty House Department Store, Southland Shopping Center, Highway 17 at Winton Ave, Hayward, California. The group also publishes a newsletter, FORTH Dimensions. Editorial material is always welcome. A subscription to FORTH Dimensions is free when you join the FORTH Interest Group for \$12 per year in the US, or \$15 overseas. Contact the group by writing, FORTH Interest Group, POB 1105, San Carlos CA 94070.

International Apple Core

The International Apple Core (IAC) is a nonprofit independent organization that will act as the parent organization for local Apple computer groups. Membership is not open to individuals, although they may subscribe to the IAC's quarterly publication. The organization will offer information on hardware, software, application notes, and programming tips to member groups. The IAC will also make its library accessible to member groups. For more information, Apple user groups can contact the International Apple Core, POB 976, Daly City CA 94017.

Free Pascal Newsletter

The Pascal Newsletter has articles of general interest to computer enthusiasts, such as Pascal standards and programming techniques. Recent newsletter articles have included a history of Pascal compilers, a Pascal bibliography, a comparison of Rational Data Systems' (RDS) Pascal to competitive products, and a section on matters of programming style. Free subscriptions to RDS's *Pascal Newsletter* and a product brochure are available by writing or calling Rational Data Systems, 245 W 55th St, New York NY 10019, (212) 757-0011.

A Computer Group in Amarillo

The High Plains TRS-80 Users Group of Amarillo, Texas, meets the second and fourth Tuesdays of every month at the downtown branch of the Amarillo Public Library on 413 E 4th St, from 7 to 9 PM. The annual dues are \$15. For information, write High Plains TRS-80 Users Group, POB 30545, Amarillo TX 79120.

TBUG-80 in Florida

This group in Tampa Bay, Florida, supports the use of the TRS-80 for games and business applications. Tutorial sessions at the meetings cover everything from the proper operation of the hardware to diskbased programming techniques. The club's newsletter contains program notes, reviews of products for the TRS-80, and letters of

Apple for the Teacher

Apple for the Teacher is a user group with emphasis on the educational uses of the Apple computer. Its newsletter features reviews of educational software, plus current information on educational computer grants and research. The group operates the national computer-aided instruction library for the Apple and is receiving donations from throughout the world. Contact Apple for the Teacher, 5848 Riddio St, Citrus Heights CA 95610.

Computer Society in Washington

The Whidbey Island Computer Society (WICS) is dedicated to promoting education and fellowship in the realm of home computing. The only requirement for membership is an interest in the field of microcomputing. The group currently has an AIM-65, Apple II, Heathkit H8, TRS-80, Exidy Sorcerer, and a Z80 homebrew system. WICS meets monthly on the second and fourth Saturday. For further information. contact Dee Minter, 1616 Larch Dr, Oak Harbor WA 98277, (206) 675-7964.

Gosub—TRS-80 Users Group

Gosub TRS-80 Users Group was formed to provide TRS-80 users with a place to exchange ideas, information, and other computer-related material. The group meets on the third Sunday of each month in the computer room at the Camar Corporation, 186 Prescott St, Worcester, Massachusetts. The meetings run from 2 to 5 PM. Membership dues are \$6 per year and include a subscription to a monthly newsletter. The mailing address is POB 712, Worcester MA 01613, (617) 845-1851. ■

BYTE's Bits

First National Conference on Artificial Intelligence

Stanford University in Palo Alto, California, is hosting the first annual National Conference on Artificial Intelligence. The conference will be held from August 18 thru the 21. It is being sponsored by the newly created American Association for Artificial Intelligence (AAAI) in cooperation with SIGART. The topics will cover robotics, cognitive modeling, vision, problem solving and search, artificial intelligence languages and software, theorem proving, theoretical foundations, mathematical foundations, specialized systems, and more. Many artificial intelligence research groups and manufacturers will be demonstrating AI and other computer hardware and software. A tutorial program on August 18 will examine the current artificial intelligence research in this country. The AAAI is a group whose purpose is to study and disseminate information on AI in the US. AAAI officers are Allen Newell of Carnegie-Mellon University, president; Edward Feigenbaum of Stanford University, presidentelect; and Donald Walker of SRI-International, secretarytreasurer. Membership information may be obtained by writing to Dr Bruce Buchanan, AAAI Membership, Computer Science Dept, Stanford University, Stanford CA 94305.

Our program can solve the difficult endgame problem on the right (solution 22-18, 9-13, 18-15, 13-17, 11-16, 3-8, 16-12, 8-3, 15-11, 17-22, 12-16). It also has

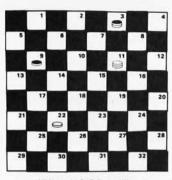

- main lines for most of the ACF 3move openings in its book
- special coding for 2 kings vs 1 and 3 vs 2 with defenders in the double corners
- the ability to take back moves
 the ability to set up board positions
- recent moves displayed along with text or graphics representation of board position
- 9 levels of play
- the ability to run in 16K RAM on a Z-80
 a \$24.95 price tag

Gomoku

Our Gomoku program was the highest ranking program in the 1980 North American tournament. It has two levels of play, and is available with 19 by 19 (except TRS-80) or 16 by 16 (except CP/ M) board. It was written by the 75, 77, 79 North American champion, requires 32K RAM (for N*DOS must begin at loc. zero), and costs \$29.95.

Guess Five

This number guessing program uses five digits, each valued 0 thru 7 making 32768 possible numbers. When the program is guessing it typically makes four guesses from book, one by short calculation and hits on the sixth guess. You have to try this to believe how high that standard is. It requires 8K RAM and costs \$19.95.

M7 Communicator

A complete A/D and D/A Control System –

Interface your computer to the analog world of process monitoring transducers and controlling actuators.

The M7 multiplexes analog and digital signals from your process sensors – temperature, pressure, level, flow, mass, strain, etc. – and continuously down-loads this data in digital form to your computer for display and processing. Simultaneously, command signals are transmitted to the control devices in your process.

Order a complete basic M7 System ready for round-theclock process control-

including a 16/32-Channel A/D Input Module (expandable to 256 channels), a Computer Interface Module, and a 4-Channel (expandable) D/A Output Module. Supplied complete with cabinet, power supply, and all necessary hardware and software for basic control. Bus accommodates eight additional modules. Specify computer make

You can talk to <u>more</u> computers, faster and easier, with the VET/2 from SCOTT

The Scott VET/2 is a compact, highly versatile Voice Entry Terminal developed for TRS-80 users — and available soon for the PET and APPLE computers. Key features of the VET/2 include:

- Easy to use all programs may be written in Level II BASIC. One USRn statement is all that's needed to allow your program to be voice controlled.
- Performance comparable to systems costing \$10,000 or more.
- High accuracy (98+%) and fast recognition.
- · Supplied with demo programs and software tools.
- · Connects directly to screen printer I/O port.
- Simplified training mode with automatic prompting.
- Overlay features make vocabulary size virtually unlimited.

The user manual fully describes the operation and training procedures for the VET/2 and includes complete instructions on interfacing the VET with BASIC programs.

All hardware covered by 90-day warranty. Software guaranteed for replacement only. Prices subject to change without notice.

Liquid-Crystal Displays

Dear Steve,

I recently examined a Milton Bradley Microvision miniature video game, which features a 1.5-inchsquare liquid-crystal display (LCD) consisting of 16 rows of 16 square blocks. I want to build a circuit to drive this display unit. How difficult would it be to modify the circuit you presented for use with an 8-by-16 array of light-emitting diodes (LEDs)? (See "Self-Refreshing LED Graphics Display," by Steve Ciarcia, October 1979 BYTE, pages 58 thru 69.) The LCD display unit could provide useful capability to a single-board microcomputer.

I have also considered developing a programmable game cartridge for the Microvision console. The console contains two 9 V battery cells, a voltage regulator, a potentiometer "paddle control," a piezoelectric beeper, a 4-by-3 printed-circuit keypad, the LCD unit, and a 40-pin dual-inline-package integrated circuit that appears to be the display driver. The Blockbuster game cartridge that comes with the console contains a 28-pin integrated circuit, a window for the display, and labeled cutouts for four control keys, along with passive components. Communication between the cartridge and the console is via a 24-pin connector.

I don't expect you to design circuits for me; if you did that for everyone who writes, you would not have enough time for your own work. However, you could do me a real favor by identifying two integrated circuits in the Microvision game. The first has 40 pins and is marked "SCUS0488, H 7920." The second has 28 pins and is marked "TMS1100NLL, MP 3450A, DBU7932."

I hope you will keep up the good work. Daniel Q Dye Jr

A lot of people are interested in using the LCD unit you mention. However, LEDs (light-emitting diodes) and LCDs have very different principles of operation. An LED becomes a source of light when you pass an electric current through it, consuming a fair amount of power. LCDs, on the other hand, act as voltage-controlled reflectors of light. When an AC voltage (not DC) is applied to a liquid-crystal display, the liquid changes from transparent to opaque, consuming relatively little power. Because of this, the design approach in my LED project does not work for LCDs. But don't despair: 1 Continued on page 238

Omikron's Mapper + NEWDOS/80 8" Drives for the TRS-80

NEWDOS/80 is Apparat's latest upgrade to NEWDOS. Features include variable length records, chaining, and drivers specifically configured for Omikron's MAPPER II. \$150.

MAPPER II adapts the TRS-80 to run both 5" and 8" drives. With NEWDOS/80, storage is increased to 300K per 8" drive. \$99 plus \$10 per cable connector.

MAPPER I adapts the TRS-80 to run the vast library of CP/M software as well as the TRS-80 software. All Lifeboat Software may be ordered for the MAPPER I. All MAPPER I CP/M software is compatible with the CP/M for the Model II. With MAPPER II and 8" drives, the Model I becomes disk compatible with the Model II. Standard features include lower case support, serial and parallel printer drivers, and an addressable cursor. MAPPER I is supplied with complete utilities including a memory test, a disk test, a copy program, and a proprietary program for converting TRS-DOS files to CP/M files. \$199.

WORD PROCESSING-MAPPER I supports professional word processors like the Magic Wand and Word Star (see reviews in June 80 Kilobaud). Omikron's implementation includes a blinking cursor, auto repeat, shift lock, debouncing, and an input buffer that eliminates missed characters. Magic Wand super discount price \$299.

FIELD PROVEN DESIGNS-After one year of MAPPER production, Omikron has established an impeccable reputation for reliability, integrity, and user support. Omikron's customers include the US Government, major corporations, universities, medical doctors, and professionals in all fields.

SYSTEMS-Omikron sells complete systems featuring Model II compatible Shugart disk drives. Call for prices and delivery.

FOREIGN ORDERS must include full payment in US funds plus \$25 for air shipping and handling.

Continued from page 234: have written a tutorial article on LCDs to be presented in the October Ciarcia's Circuit Cellar.

Concerning the components in the Microvision: the 28-pin device is a Texas Instruments TMS1000-series 4-bit microprocessor, that uses CMOS (complementary metal-oxide semiconductor) technology. The program for the Blockbuster game (or other game) is contained within it in a read-only memory. The 40-pin part is a custom multiplexed display-driver circuit for the LCD unit. The display driver is driven through the I/O (input/output) lines of the microprocessor. I hope I've helped. Steve

The Very Busy Box

Dear Steve,

In all of your articles (which I read avidly) I have not seen any projects directed towards the Heath H8 computer system. I constructed my H8 hoping to learn about computer hardware, but instead found myself only following instructions. I find it very difficult to apply your projects to my system. It would be of great benefit if, in one of your articles, you would include information on interfacing your "house controller" (see "Computerize a Home," January 1980 BYTE. page 28) to the H8.

Bearing in mind that we H8 owners are basically hardware-oriented, I believe that we would be more likely to construct a project than someone who purchased a system completely assembled. Please consider the H8 in future articles; I am sure that the reception will be well worth the effort.

Ted Benglen

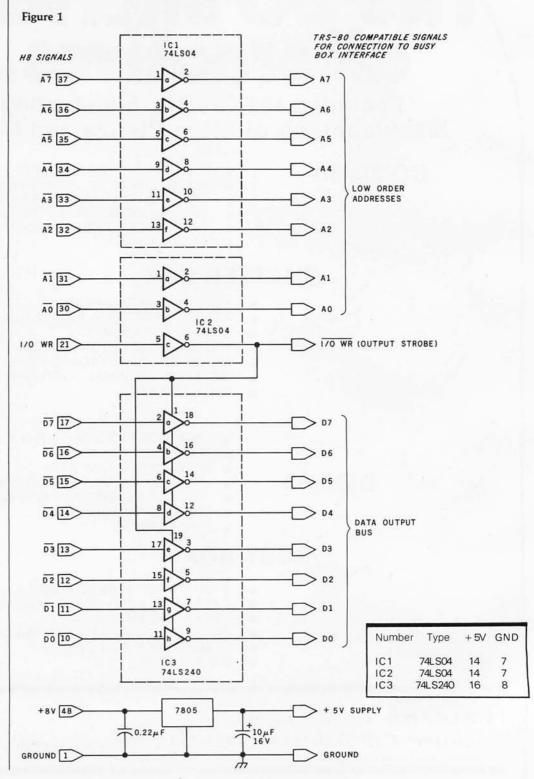

Most computers are equal where interfacing is concerned. If you look closely at the bus signals on your H8 you will notice a striking similarity between their names and the names of signals on the Apple and the Radio Shack TRS-80. The BSR interface (trademarked "Busy Box") requires an I/OWR* strobe (the "*" indicates a negative-true signal), address lines A0 thru A7, data lines D0 thru D7, and power. All address and data bus lines on the H8 use inverted logic levels, so the circuit of figure 1 is necessary to make the system compatible with the TRS-80 attachment shown in the article.

I generally try to list signal inputs so that experimenters will not be discouraged by a title that says "TRS-80" or "Apple." For simple input and output ports, the signals are often easily accessible and compatible among systems. **Steve**

ANNOUNCING VULCAN DBMS Version 1.6

The Complete DataBase Management System for your 8080/Z80 CP/M[®] System

You tell **Vulcan DBMS** what you want done with your data, not how to do it. **Vulcan DBMS** currently is being used to handle name and address lists, form letter mailing, task scheduling, finance management, telephone lists, and inventories just to name a few. Entire application systems can be built up rapidly by using the interactive capability to design the application and then saving the commands as programs for future use. Specialized needs for data access can be done instantly using the interactive capability.

FEATURES

- * Easy to learn, easy to use English-like commands
- * Full-screen data entry and editing for most 24 X 80 terminals
- * User customizable full screen formatting for input or display
- * Indexed sequential organization of databases permits very fast access of selected records (Vulcan DBMS uses B-tree's)
- * Two separate databases can be processed at once
- * The only microcomputer DBMS that can implement a relational database model
- * Report writer allows subtotaling and summary reports
- * Up to 32 fields per data record
- * Plus all the features of Vulcan DBMS version 1.5 including:
 - * written in assembly language for fast execution
 - * records of up to 1000 characters
 - * databases can be up to 65,535 records long

Off" (July 1979 BYTE, page 34) quite intriguing. The potential of computercontrolled music generation inspired me to purchase a Commodore PET, but the tones generated by my rudimentary system are not exactly musical.

I would appreciate any improvements and suggestions you might have. The limiting factor in my case, and I am sure this is true for others, is lack of proficiency with the instrument. **Jack Hobson**

My talents are geared more toward building the instrument than making music on it. If you are reasonably adept at building circuitry, there is a way to run the General Instrument AY-3-8910 Programmable Complex Sound Generator from the parallel user port (J2) of the PET. The clocking of the integrated circuit is not critical, only the sequence of events, but the circuit does require 11 bits of information.

UCSD* System for TRS-80 Model II*

The most portable operating system now supports FORTRAN. Pascal and/or FORTRAN modules are compiled in universal P-code, so they can run on most microprocessors, often without recompiling. Programs execute up to 10 times faster than comparable BASIC programs, and use much less memory. Ready to run on TRS-80 Model II (64K).

FEATURES

- Interactive operating system-dynamic overlays, disk file handling, run-time support and block I/O routines.
- Fast, one pass compilers.
- Two Editors—one screen oriented for programming and text editing, one character oriented for hard copy terminals.
- File handler to manipulate disk files.
 Macro-assembler that produces code for
- linking with Pascal or Fortran programs. • Linker for link-editing of object and as-
- sembly code modules.Library of program modules and utilities.

PLUS, from PCD Systems

- Disk formatting program to initialize diskettes in single or double density formats.
 Configuration program for serial I/O.
- Configuration program for serial 17O.
- Disk-set program to permit separate assignment of density and format characteristics for each disk drive.

The circuit of figure 2 here uses only 74LS95 4-bit parallel-access shift registers. IC1, IC2, and IC3 are paralleled to form a 12-bit shift register, and IC4, IC5, and IC6 make up a 12-bit latch. By setting the appropriate logic level on bit 7 of the user port, the information will be loaded into the 12-bit register when a

high/low/high transition occurs on bit 1. When 12 bits have been loaded, a low/high/low transition on bit 0 can be used to latch the binary value and stabilize the information while more is loaded.

The fast action of the shift and store operations should be fairly transparent to the AY-3-8910, which should operate as described in the article. Steve

Power to the Computer

Dear Steve,

I would like to suggest a possible future subject: backup power for microcomputers. I am very interested in home control and security, but the more responsibility and power I give my system, the more strongly I feel that it should have an uninterruptible

power source (UPS). Stanly W Pozeisky

12 TO 48 VDC STORAGE BATTERY

RECTIFIER/

CHARGER

Thank you for your suggestion. I have also been considering uninterruptible power supplies. I have a 26 K-byte Z80 computer running 24 hours a day, and an UPS is a requirement. Unfortunately, when we start talking about running the computer and disk drives, we start talking about quite a bit of power. This could conceivably require several hundred watts, so a system similar to those used in commercial installations might be in order. (See figure 3.)

This system uses battery backup, with a large inverter to supply normal AC during an outage. Designing power inverters is an art in itself, and considerable care must be taken so as not to run afoul of the FCC radiofrequency interference (RFI) standards. While I mull this over, you might want to obtain a copy of the February 1980 issue of Digital Design for a good article on the subject. Steve

the electric pencil II"

for the TRS-80 Model II* Computer

The Electric Pencil is a Character Oriented Word Processing System. This means that text is entered as a continuous string of characters and is manipulated as such. This allows the user enarmous freedom and ease in the movement and handling at text. Since lines are not delineated, any number of characters, words, lines or paragraphs may be inserted or deleted anywhere in the text. The entirety of the text shifts and opens up or closes as needed in full view of the user. Carriage returns as well as word hyphenation are not required since each line of text is formatted automatically.

As test is hyped and the end of a screen line is reached, a partially completed word is shifted to the beginning of the following line. Whenever test is instructed events in terrs is pathed down or pulled up intrust or deleted, existing text is pathed down or pulled up intrust or deleted, existing text is pathed down or pulled up intrust or deleted, existing text will be variable speed or poper-to-time scribing bath in the forward and reverse directions, any using the search or the search and replace function, any string of characters may be located and/or replaced with any other string of characters as desired. Specific sets of characters within encoded strings may also be located.

When text is printed, The Electric Pencil automatically inserts carriage returns where they are needed. Numerous combinations of Line Length, Page Length, Character Spacing, Line Spacing and Page Spacing allow for any form to be handled. Right justification gives right-hand margins that are even. Pages may be numbered as well as titled.

No More Scanner

Dear Steve,

I have been reading BYTE for over a year now and I find your Circuit Cellar articles useful and informative. I would like to read your article "I've Got You in My Scanner: A Computer-Controlled Stepper Motor Light Scanner," November 1978 BYTE, page 76. I am writing you because this article is no longer available through BYTE's back-issue department. Can you direct me to a source for this article?

Walter A Filimon

Thank you for the vote of confidence. There are a number of sources you can use for articles of BYTEs past: BYTE often has back issues which are available for the cover price plus postage. Give BYTE a call on their toll-free number (800) 258-5485; they'll be glad to help. If your interest is specifically in my articles, let me suggest that you pick up a copy of the compendium book Ciarcia's Circuit Cellar, volume 1, from BYTE Books. It contains most of my articles, including the November 1978 one. It has the extra advantage that any proof errors in the original articles are corrected. BYTE Books may be contacted at 70 Main St. Peterborough NH 03458. Steve

A Message to our Subscribers

From time to time we make the BYTE subscriber list available to other companies who wish to send our subscribers promotional material about their products. We take great care to screen these companies, choosing only those who are reputable, and whose products, services, or information we feel would be of interest to you. Direct mail is an efficient medium for presenting the latest personal computer goods and services to our subscribers.

Many BYTE subscribers appreciate this controlled use of our mailing list, and look forward to finding

information of interest to them in the mail. Used are our subscribers' names and addresses only (no other information we may have is ever given).

While we believe the distribution of this information is of benefit to our subscribers, we firmly respect the wishes of any subscriber who does not want to receive such promotional literature. Printer Uses Plastic and Metallized Daisy Wheels Interchangeably

A series of serial impact printers that produce typewriter-quality output for word processing, data processing, and communications applications has been announced by Diablo Systems Inc, 24500 Industrial Blvd, Hayward CA 94545, (415) 786-5207. The Model 630 daisy-wheel printers use plastic and metallized print wheels interchangeably, with print speeds from 32 to 40 cps (characters per second) depending on the type of print wheel, type style, and text. Model 630 printers accept all Diablo and Xerox plastic and metal print wheels. Friction and pin-feed platens and other paper-handling options are offered. The 630 series supports the RS-232C/V.24 interface for communications applications, and a microprocessor interface that permits direct attachment of the printers to a variety of small office and data processing systems. The price is \$860 in original equipment manufacturer's (OEM) quantities of 500.

An RS-232 Card Reader

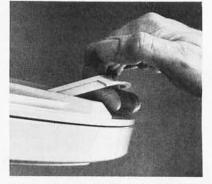

The Model 121-4 card reader is capable of reading any common punched or marked card and includes serial RS-232 or card image output (with Hollerith-to-ASCII conversion if necessary), parallel 20 mA current-loop output, self-clocking on both marked and 80-column punched cards, or operation with printed strobe marks on either side of the card. The 121-4 may be set for card feed-through at 6 ips (inches per second), or automatic return of cards to the front after reading. This card reader also has a self-test feature which enables the user to check sensor accuracy. The Model 121-4 operates on either 50 or 60 cps (characters per second) and sells for approximately \$520 in original equipment manufacturers quantities. For more information, contact HEI Inc, Jonathan Industrial Center, Chaska MN 55318, (612) 448-3510.

Removable Disk Cartridges for CDC and Ampex Drives

The 4420 is a removable disk cartridge for use on Control Data's cartridge module drive (CMD) 9448 series and equivalent disk drives. The product is capable of storing up to 16 megabytes of data. The disk cartridge uses one surface to record data and one surface to func-

tion as a dedicated servo reference. Density is 348 tracks per inch, with 823 tracks per surface. The cartridge is available with factory formatting. For information, contact Nashua Corporation, 44 Franklin St, Nashua NH 03061. Circle 491 on inquiry card.

Two Printers from Facit

Facit Inc, 66 Field Point Rd, Greenwich CT 06830, has developed two printers, the 4520 and the 4542. The 4520 is a bidirectional printer with a speed of 100 cps (characters per second) and a noise level of less than 60 dB. The 4520 is microprocessor-controlled, with a 100% duty cycle. The printer utilizes a 9-by-9 dot matrix, while accommodating paper-roll or fanfold forms. A serial or parallel interface is included. The unit price is under \$1000.

The 4542 provides the full graphic capability and control of Facit's 9-by-9 matrix Stored-Force Flex Hammer Head. It features two-color printout, gray scale, and proportioned spacing. All European versions, Katakana, APL, and Libris character sets are available. The 4542 lists for under \$4000.

Modem Eliminator

International Data Sciences Inc, 7 Wellington Rd, Lincoln RI 02865, (401) 333-6200, has introduced the Model 6100 modem eliminator. The unit allows interconnection of data-terminal equipment without modems. It can be used in asynchronous or synchronous modes, and with terminals configured for halfor full-duplex operation. The IDS modem eliminator also eliminates the need for two back-to-back modems operating within a short distance. Features include internal strap selections for primary and secondary RTS/CTS delays, ring memory functions, and clock source. Data-terminal equipment can be located up to 50 feet from the modem eliminator, allowing a maximum separation of 100 feet. Its DTE interface conforms to EIA RS-232C and CCITT V.24 standards. The Model 6100 is priced at \$360.

Where Do New Products Items Come From?

The information printed in the new products pages of BYTE is obtained from "new product" or "press release" copy sent by the promoters of new products. If in our judgement the information might be of interest to the personal computing experimenters and homebrewers who read BYTE, we print it in some form. We openly solicit releases and photos from manufacturers and suppliers to this marketplace. The information is printed more or less as a first in first out queue, subject to occasional priority modifications. While we would not knowingly print untrue or inaccurate data, or data from unreliable companies, our capacity to evaluate the products and companies appearing in the "What's New?" feature is necessarily limited. We therefore cannot be responsible for product quality or company performance.

Computhink Unveils Small-Business Computer

Computhink Inc. 965 W Maude Ave. Sunnyvale CA 94086, (408) 245-4033, is now offering Minimax, a microcomputer system designed for small businesses and independent software organizations. The Minimax can store over 100 K bytes of internal memory. By using various configurations of floppy-disk drives, the system can have an on-line disk storage capacity ranging from 800 K to 4.8 megabytes. A 6502 microprocessor is used in the system. The system features full-screen data entry, field protect and automatic skip to the next field, and split screen operation. The Minimax, with 800 K bytes of disk storage, has a suggested retail price of \$7770. A configuration with a printer is under \$10,000. These prices include businessapplications software.

Introducing the QDP-100 System

This product is a Z80A-based S-100 machine. The single-board unit contains the microprocessor; two serial and two parallel ports; a double-sided, doubledensity disk controller for 5- and 8-inch floppy-disk drives; an Intel-like 2716 programmable read-only memory (PROM) burner; a real-time clock; and a 2 K-byte monitor. The operating system is CP/M 2.2. A 4 MHz, 64 K-byte dynamic memory board is also supplied. The video display is a "smart" terminal with 80-character by 24-line display, a 25th status line, reverse video, blinking and half-intensity characters, protected and unprotected fields, and other features. The display uses a Z80 microprocessor for display operation. A hard-disk system can be integrated into the system. Accounting, data-base management, word processing, real estate, statistics, and other software packages are offered by Quasar. The price for the QDP-100 is \$4795. EPROM Programmer with RS-232 Interface

This erasable programmable read-only memory (EPROM) programmer, Model EP-2A-87, with RS-232 and 20 mA loop interfaces, has been introduced by Optimal Technology Inc, Blue Wood 127, Earlysville VA 22936, (804) 973-5482. The programmer includes a 2 K- or 4 K-byte buffer which can be loaded or read by another computer in the on-line mode. Data rates are 110 and 1200 bps (bits per second). In the off-line mode, a keyboard enables the operator to program, verify, and check if the EPROM is erased, and load the buffer from EPROM. EPROMs may be copied in the off-line mode by first loading the buffer from the programming socket. A built-in self-test includes provisions for checking the buffer and whether the EPROM will enter the high-impedance state. Priced at \$600 with a 4 K-byte buffer, personality modules are \$16 to \$35 for programming various EPROMs on the market. Circle 499 on inquiry card.

6502-Based Single-Board Computer

Compas Microsystems, 224 S E 16th St, Ames IA 50010, (515) 232-8187, has announced CSB 2, a stand-alone module based on the 6502 microprocessor. The board is compatible with the Rockwell System 65 bus standard. EXORcisorbased cards may be used with CSB 2 with minor modifications. CSB 2 includes a 6502 microprocessor, 2 K bytes of static programmable memory, four sockets for Intel 2716 or 2764 erasable

programmable read-only memory (EPROM) integrated circuits, one VIA (6522), one PIA (6520), and one ACIA (6551). CSB 2 provides 30 input/output (I/O) lines, ten buffered output lines, two interval timers, input latching on peripheral ports, an RS-232 port with data speeds from 110 to 19,200 bps (bits per second), and up to 32 K bytes of EPROM space. CSB 2 is priced at \$395 and the manual is available for \$4. Circle 500 on inquiry card.

Reset Extender for TRS-80

The Reset Extender is an aid for TRS-80 owners who have trouble accessing the Reset button in the back of the keyboard. Most TRS-80 owners use a pencil to hit the Reset button. With little effort, the Extender attaches to the hood and simplifies reset tremendously. The Reset Extender is available from Emmanuel B Garcia Jr & Associates, 203 N Wabash, Rm 2102, Chicago IL 60601, (312) 782-9750, for \$3.99. Circle 501 on inquiry card.

Microprocessor-Controlled Floppy-Disk Drive and Controller

The System 2000/10 is a microprocessor-controlled floppy-disk drive and controller that plugs into the Teletype Model 43, the Texas Instruments Silent 700, and similar typewriter terminals. The System 2000/10 can operate as a stand-alone word processor, or as an on-line, storage, edit, and forward unit. In the on-line mode, the data rate is capable of reaching 9600 bps (bits per second). In the on-line mode, it can be invisible to the host computer. The system can also be used with ADM-3A, Televideo 912, and similar video displays. A software package includes global search and global replace commands. Options include extra programmable memory up to 64 K bytes, a printer port, Telex interface, BASIC and IBM 3740 compatibility. The price for the System 2000/10 is \$1695. Commercial Calculators from Texas Instruments

Texas Instruments has announced a family of heavy-duty commercial calculators incorporating the Seiko 350 mechanical printer. Ranging in price from \$160 to \$205, the TI-5213, -5215, -5217, and -5219, have been designed for operator comfort and reliability. Each model features two-key rollover and 10-level keyboard buffering. The printer delivers 2.8 lines per second using standard 5.8 cm (2.25 inch) paper and prints up to twelve digits plus commas, decimal point, and two-column audit trail. Other features common to all four models include multiplication and division by a constant, automatic computation of percentage calculations, independent add register, grand total register, grand total on/off switch, decimal selector, automatic rounding, and item count. Inquiries should be addressed to Texas Instruments Inc, POB 10508, M/S 5889, Lubbock TX 79408.

Serial Communications and Control on a Single Card

Vantage Data Products has developed a single-card computer for use in communications and control applications. The Z80-based card is used with serial input/output (I/O), parallel I/O, programmable memory, and erasable programmable read-only memory (EPROM). Serial communications are asynchronous RS-232 and programmable to all standard data rates up to 5600 bps (bits per second). Modem-control functions are also included. Power requirements are +5 V and +12 V. Negative voltage for RS-232 communication is generated on the card. Options include a software-monitor program on EPROM for operation of the computer with a terminal, and single powersupply options. The suggested retail price is \$195. Floppy-Disk Drive Power Supplies

Powertec Inc, 20550 Nordhoff St, Chatsworth CA 91311, (213) 882-0004, has introduced the FD series of floppydisk, dual-output power supplies. The FD101 delivers main channel outputs of +5 V at 0.75 A and secondary channel outputs of +12 V at 1.8 V. The FD101 offers flexible strap-selectable inputs of 103-127/206-254 VAC, single phase 47 to 440 Hz. Standard features include overvoltage, overload, short circuit and reverse voltage protections, no turn-on or turn-off overshoot, and a one-year warranty. The supplies provide line regulation of $\pm 0.5\%$ for a $\pm 10\%$ input line change, and static loads of 50 to 100%. Load regulation for the units is $\pm 0.5\%$ on all outputs for a 0 to 100% load change, 5 mV peak-to-peak maximum ripple, 0.03°C temperature stability over full operating ranges and 0.3% drift for a 24-hour period. Transient response is less than 50 ms for a 50% load change. Contact the company for prices and availability. Circle 506 on inquiry card.

Bidirectional Totalizer

The DigiTec Model 8222 bidirectional totalizer is used for counting functions in industrial processes or product-test systems where up-down counting is required. All up-down counting functions, with count direction control, are userprogrammable. Operating modes include totalizing two inputs by adding and/or subtracting one from the other based on phase relationship or logic input. Software response ensures that every pulse is added or subtracted even during simultaneous occurrence. The Model 8222 is available with either a 5- or 7-digit LED (light-emitting diode) display. Both models offer polarity and overflow indication. The unit is 4.8 by 18 by 19 cm (1.89 by 6.6 by 6.86 inches), and the cost is \$415 for the 5-digit model and \$467 for the 7-digit model. A Talking Voltmeter

This talking voltmeter allows users to keep their eyes on the probes and avoid shocks, short circuits, and blown integrated circuits. It is also an aid for the visually handicapped. The dual microprocessor-based system provides voltage readings that are automatically announced via an internal 3-inch speaker every 7 seconds, or upon operator command. A slave processor selects the speech elements that are required by the measurement, while the main processor controls the system timing and signal processing. The instrument is powered by a rechargeable nicad battery pack. It weighs 1.1 kg (2.5 lbs) and measures 6.2 by 25.5 by 23 cm (2.5 by 10 by 9 inches). An earphone jack is provided for work in noisy environments. Options include an LCD (liquid-crystal display), current and resistance measurement circuits, and a serial interface for recording the digital output on audio cassette recorders. Foreign languages are also available. The price is \$395. For details, contact the Franklin Institute Research Laboratory Inc, The Benjamin Franklin Pky, Philadelphia PA 19103, (215) 448-1340.

The Z-88 Processor Card

The Z-88 offers 16-bit processing power to S-100 bus users. The card combines a Z80A and an 8088 microprocessor to allow access to all currently available 8080 software without the need to translate into 8086 machine language. The 8088 is fully software compatible with the 8086, so all 16-bit software, such as Microsoft 8086 BASIC, will run on the Z-88. The Z-88 features an 8-bit data bus that uses existing products without modification; direct memory address of 16 megabytes; selectable IEEE Preliminary Standard or Altair/Imsai S-100 bus: no wait states with 450-ns memory access; vectored or noninterrupting modes that transfer control between processors; a 1 K-byte phantom read-only memory (ROM) which initializes the microprocessor; and an 8-level TTL (transistor-transistor logic) priority-vectored interrupt. 6800 C Compiler

Wintek has introduced a C compiler for the 6800 microprocessor. The compiler includes the features described in the book The C Programming Language by Kernighan and Ritchie (Prentice-Hall). C is a structuredprogramming language for operating systems and numerical, text-processing, data-base programs, and other general applications. Characters, numbers, and addresses can be combined and efficiently moved about with the 6800 arithmetic and logical operations. Consequently, C is very efficient in the amount of 6800 code generated. C provides pointers and the ability to do address arithmetic. Any function can be called recursively and its variables declared in a block-structured fashion. Variables may be internal, external, or global. Functions of a C program can be compiled separately. The C compiler is intended to run under the Wizrd multitasking disk operating system on the Sprint 68 microcomputer. The cost for C is \$495. The cost for the Sprint 68 with 48 K bytes of programmable memory, dual 8-inch floppy-disk drives, and Wizrd is \$3995, Contact Wintek Corporation, 1801 South St, Lafayette IN 47904, (317) 742-8428.

A new version of the FLEX disk operating system is available for users of custom or nonstandard 6800 and 6809 systems. Developed by Technical Systems Consultants Inc, POB 2570, 1208 Kent Ave, West Lafayette IN 47906, (317) 463-2502, it is fully compatible with most versions of FLEX. FLEX supports features such as dynamic file-space allocation, random and sequential file accessing, user startup facility, user environment control, English-language error messages, and over twenty commands for normal disk operations. This version contains a manual describing how to write disk and terminal input/output (I/O) routines to adapt FLEX to most any hardware. The only major system requirement is a softsectored floppy-disk drive that uses 256 bytes per sector. When the adaptation is complete, the user's system will be capable of running any standard FLEX software. The \$150 price includes the FLEX disk with editor and assembler, and a set of manuals.

The Datahandler

The Datahandler is a data-base management system running in MMSFORTH on the TRS-80 Model I with at least 32 K bytes of programmable memory and one floppy-disk drive. Users can specify up to ten data fields appropriate to each particular job. Standard and special report formats can be output to the screen and the printer. The Datahandler includes mail-list and checking-account programs with custom report commands and sample data files. It can sort a typical 100-record file in 5 seconds, and lookups take less than 1 second. An indexed-key structure incorporates string and value selection mechanisms including normal-compares and values inside or outside a range. One feature allows the program area of the Datahandler disk to be software write-protected, while the data-file area is left open. Regularly used system configurations may be precompiled for 5-second loading times. Additions to the Datahandler will be a report-generator module and a large-data-files module. SL5—A Software-Development Tool

SL5 is a software-development tool for small systems. It is an interactive programming system with an integral compiler, interpreter, assembler, disk operating system, and library of procedures. SL5 is based on the recommendations of the 1977 FORTH Standards Committee. Since SL5 is written in SL5. it adapts to most microcomputer operating systems. A host-executable code kernel, a source-code kernel, and a system-generation program are provided. The system generation program regenerates the kernel from the source or generates compact stand-alone read-only memory (ROM) object modules. An SL5 development system requires less than 32 K bytes of memory. Most applications programs require less than 8 K bytes. SL5 reads and writes standard CP/M files. Versions are available for both the 8080 and Z80. The Z80 system uses the additional registers and instructions of the Z80, and contains an assembler with Z80 mnemonics. The single-system price of \$150 includes complete source code and a manual. Original equipment manufacturer (OEM) and resale licenses are available. For more information, contact The Stackworks, POB 1596, 321 E Kirkwood Ave, Bloomington IN 47402, (812) 336-1600.

Word Processor and 8810 System from PolyMorphic

Wordmaster II is a menu-driven word processor. The program enables users to create, edit, format, and print documents. It is designed for PolyMorphic Systems 8810 or 8813 computers. The program can print with two-color ribbons, print in boldface, print superscripts, subscripts, and multipleline headers and footers. Repetitive spelling, phrase, or numerical errors can be easily changed. The System 8810 with Wordmaster II is available for under \$9000, including the NEC Spinwriter or comparable printer. What's New

Matrox Computer Systems MACS-10

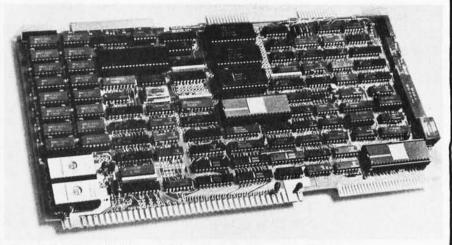

The MACS-10 microcomputer system combines Multibus-based hardware with the CP/M 2.0 disk operating system. The system is configured around the Z80A microprocessor and includes 48 K bytes of programmable memory and sockets for 8 K bytes of ROM (readonly memory) and EPROM (erasable programmable read-only memory). A 2 K-byte monitor, a dual 8-inch doubledensity floppy-disk drive, a disk controller, and interfaces for a video terminal and line printer are also included. Other peripherals can be connected through additional ports at the rear of the chassis. The microprocessor and floppy-disk controller cards occupy two slots in the card cage, leaving five slots for systems expansion. If more slots are needed, up to three card cages can be stacked together for a maximum of nineteen free card slots. Optional hardware includes a 128 K-byte programmablememory card, and an alphanumeric and graphic video-display controllers. The price for the MACS-10 system is \$5990. Details are available from Matrox Electronic Systems Ltd, 5800 Andover Ave, T M R, Quebec H4T 1H4, Canada, (514) 735-1182.

The System 1000 Series from CSSN

CSSN Inc has announced its System 1000 family of microcomputers. This modular, bus-oriented line of systems is organized around the IEEE (Institute of Electrical and Electronic Engineers) S-100 standard bus. The S/1000 includes a 4 MHz Z80A microprocessor, 64 K bytes of programmable memory, an 8-inch Winchester hard disk, a 13.4-megabyte cartridge-tape data backup, a variety of I/O (input/output) devices and other peripherals, and expansion capability to 16-bit processors. It is available in different configurations of operating systems and peripherals, and retails between \$15,000 and \$20,000. The S/1000 hard-disk cartridge backup combination can store 24 megabytes. Operating systems for the series includes CP/M 2.0, MP/M, OASIS, and CSSN PDOS, a superset of CP/M 1.4. Languages such as BASIC, COBOL, FORTRAN, C, and Pascal, can be run on the systems. For further information, contact CSSN Inc, 120 Boylston St, 4th Fl, Boston MA 02116, (617) 482-2343.

AmZ800 Single-Board Computer

The Am96/4116 MonoBoard Computer uses the 16-bit processing power of the 4 MHz AmZ8002 microprocessor. Auxiliary support for the AmZ8002 includes 32 K bytes of programmable memory, 8 K bytes of PROM (programmable read-only memory) sockets, two serial and three parallel I/O (input/output) ports, and five programmable counter/timers. The two RS-232 serial ports transmit data from 50 to 9600 bps (bits per second). The parallel I/O ports break down into twenty-four lines or three 8-bit ports that can be programmed for input, output, or bidirectional operation. The computer can accept multiple interrupt channels from twentythree independent sources in nonmaskable, vectored, and nonvectored modes of operation. Eight interrupt channels are handled by a programmable interrupt controller which allocates priorities, determines modes of operation and supports direct vectoring. The Am9513 System Timing Controller incorporates five independent 16-bit counters that can count up or down in binary or BCD (binary-coded decimal) at rates up to 7 MHz. The price for the Am96/4116 is \$2145. Contact Advanced Micro Computers, 3340 Scott Blvd, Santa Clara CA 95051, (408) 988-7777.

System 800 from IPDI

The System 800 can be expanded from 64 K bytes to 2.04 megabytes of programmable memory and from 11.2 to 31.2 megabytes of disk storage on four drives. The system allows a combination of floppy and hard disks, as well as tape cartridge backup in the same system enclosure. IPDI's video-graphics card produces a display of up to 3000

A Z8000 Board from Quasar Data Products

This 16-bit Z8000 S-100 board conforms to the proposed IEEE (Institute of Electrical and Electronic Engineers) standards. The system can read and write 8-bit, 16-bit or mixed 8- and 16-bit memories. The module also incorporates on-board, single-step circuitry hardware. The clock rate is 4 MHz. An 8080/Z80 emulator enables users to employ most of the software that has been developed for the 8080/Z80 processors. The system characters of over 256 user-definable characters and symbols on a 15-inch monitor. The video-display system features sixteen levels of gray or full color and is capable of driving over thirty-two displays. For more information, contact IPDI, 2584 Wyandotte, Mountain View CA 94043, (415) 969-6086.

also has provisions to plug an 8-bit microprocessor card in the same bus as the Z8000 module, allowing software to be developed on an 8-bit system and then transferred to and executed by the Z8000. Available software includes a cross assembler, text editor, word processing software, and a business package. The QDP-8100 is available from Quasar Data Products, 25151 Mitchell Dr, North Olmsted OH 44070, (216) 779-9387, for \$6395.

STARS & STRIPES SPECIAL LIST PRICE 199.00 OUR CORNER THE MARKET PRICE \$139.00

The STAR modem from Livermore represents a significant breakthrough in the development of acoustic modems. The small, lightweight case houses a highperformance modem that competes with the highest quality standard-sized couplers available. Yet, because of its cost effective design, the STAR has become the price/performance leader in the industry.

filter provides the user with excellent outof-band rejection to assure accurate processing of the received carrier, even at signal levels of less than -47 dBm. Further, the proven soft limiter and phase lock loop discriminator yields data that is essentially jitter free.

The oscillator is built using highly stable, state-variable circuitry that delivers a nearly harmonic free, phase coherent sine wave to the telephone network, assuring com-patibility with all other 103 type modems. Because of the pureness of the sine wave, the STAR modem exceeds even the stringent harmonic requirements of all CCITT countries

FD-TST-HD

CARRIER DETECT

OR-OFF-AN

To assure accurate teleprocessing connections, the carrier detect circuitry prevents the modem from attempting to operate when excessive noise would produce errors or cause marginal operation. The circuitry also has a special amplitude sensor that prevents chatter when the received signal fades.

EXCLUSIVE ACOUSTIC CHAMBERS

The exclusive triple seal of Livermore's new flat mounted cups locks the handset into the acoustic chamber yielding superior acoustic isolation and mechanical cushioning. Designed to adapt to most common handsets used throughout the world, the STAR offers the utmost in flexibility and transmission reliability. SELF TEST

The self test feature on the STAR allows the user to verify total operation of the acoustic modem by using the terminal in the full duplex mode. No need for remote assistance in diagnosing terminal or modem problems.

Utilizing the experience gained from building high quality couplers for over twelve years, Livermore has designed a coupler superior to any in its class for cost efficiency in industrial, commercial, business or home situations. You can see why we call it the STAR!

ompuPro[™] from

- Fully static memory used throughout to promote reliable operation and facilitate direct memory access. (DMA) 4 MHz with 280 5 MHz with 8085 Buffered tri-state outputs and buffered inputs. All lines buffered; address and data lines buffered to 1 low power Schottky TTL load, all other lines buffered to less than 1 TTL load. Onboard regulation. DIP switch address selection and deselection (no wire jumpers). Low power Schottky support ICs. 5-100 boards have WRITE strobe selections switch allows use of memory with or without front panel.

- All ICs are socketed (including support chips) Unique multi-block configurations for addressing flexibility. Industry standard board sizes. High quality, double sided, plate through, solder-masked and legended circuit board.
- LOW current consumption and guaranteed specs. 1 year limited warranty (not just 90 days).
 - SALE

SALE Most ECONORAMs come in 3 forms; UNKIT (UKT) - (this means that all sockets, disc capacitors are already soldered in place for easy assembly), fully assembled & tested (A&T), or qualified under the Certified System Component (CSC) high-reliability program (200 hour burn-in, guaranteed 4MHz operation over full temperature range, serial numbered, immediate replacement in event of failure with 1 year of invoice date).

We realize that this may not look like the 8K, Econoram II board you've known and loved for so many years; however, at Godbout, good things don't come to an end - they just get better! Our NEW 8K Econoram IIA board retains all the best selling features of the old Econoram II PLUS is now 4 MHz STANDARD - still static - with ultra low power consumption. S-100 compatible. Single supply required - guaranteed maximum current under 900mA. Typical boards draw 700 to 800mA. Phantom feature is included on the new Econoram IIA and is switch selectable. Organized as two 4K independently addressable blocks. Includes switched WRITE protect - block and board disable. Also, has provision for memory management. Shipping Weight 2 lbs.

INTERFACER II

The new Interfacer II I/O board incorporates one channel of serial I/O with all the features of the INTERFACER dual RS232 serial board, plus 3 full duplex Parallel ports. The serial section includes all the features you've come to expect - a hardware UART, on-board crystal controlled Buad rate generator, hardware/software programmability, RS232 handshaking lines with real RS232 drivers, current loop & TTL drivers, full interrupts and more!!! The parallel selection utilizes LSTTL octal latches for latched input & output data with 24mA drive current, attention, enable & strobe bits for each parallel port (each with selectable polarity), interrupts for each input port, separate 25 pin connectors with power for each channel and a status port for interrupt mask and port status. All in all - an incredibly flexible and easy to use board.

CONFIGURABLE BUSINESS SYSTEM BY DMA: CGS is a data management system that allows true trans-action processing. Custom accounting systems for payables, receivables, inventory control, order entry, and general ledge can be set up without using any pro-gramming languages. CBS can be used to define an application such as an inventory control system by bepcifying master files to describe the inventory, cus-tomer and vendor files. Transaction files can then be used to describe activities such as purchases and sales. An extremely easy-to-use data entry program is used to enter information about customers, vendors, inventory, sales and purchases. After data entry is com-plete, an update program can process the transactions against the various master files, updating account balances and inventory quantities. The system features a screen menu generator and a comprehensive report generator which can be used to produce invoices, pur-chase orders, re-order reports, mailing labels or other special reports specific to the application. Good docu-mentation and a demonstration inventory system sup-plied. Requires at teast 44K memory. Does not require any support language. CONFIGURABLE BUSINESS SYSTEM BY DMA: CBS

The DG-80 Z80 CPU is the "State of the art" CPU for the Heath® H8. The power of a Z80, coupled with the flexibility designed into every DG-80, lets your imagination set the limits in possible applications with this board.

The DG-80 Z80 CPU maintains compatibility of your current system hardware and software but provides features and flexibility for future expansion. Some of the advanced features include on-board RAM, ROM, and EPROM capability, jump-on-reset to any 1K boundary, and operational speeds up to 4 MHz. The DG-80 affords the user a superior alternative to the 8080A.

Don't be mislead by the low price of this outstanding wordprocessing

Don't be mislead by the low price of this outstanding wordprocessing package. PIE 2.0 is a powerful text editor and print format processor that has all the bells and whistles expected of wordprocessing soft-ware costing three times as much. Some features include: 1) Characteriline insert and delete 2) Complete Cursor mobility 3) String search forward and backward 4) Single, conditional or global search and replace 5) Move and/or copy blocks of text 6) Page scrolling 7) Tabs, margins, paragraphing, etc. Research conducted by IBM Corp. revealed that the time required to create, edit and complete a one page document was decreased by as much as 60% when comparing the performance of a Wordprocessing system to an ordinary typewriter. Finding ways to remain competitive can substantially improve their daily productivity level with PIE 2.0 Wordprocessing software and an Apple II computer with 32k RAM memory.

memory. As a businessman you want every dollar you spend to count, so wordprocessing makes sense, and PIE 2.0 Wordprocessing software gives you more for your hard earned dollar. PIE 2.0 Wordprocessing software comes complete with program diskettle and detailed documentation in a handsome, simulated leather binder. Cat No. 2562

RCA Cosmac Super Elf Computer \$106.95

Compare features before you decide to buy any other computer. There is no other computer on the market today that has all the desirable benefits of the Super Elf for so little money. The Super Elf is a small single board computer that does many big things. It is an excellent computer for training and for learning programming with its machine language and yet it is easily expanded with additional memory, Full Basic, ASCII Keyboards, video character generation, etc.

Before you buy another small computer, see if it includes the following features: ROM monitor; State and Mode displays; Single step; Optional address displays; Power Supply; Audio Amplifier and Speaker; Fully socketed for all IC's; Real cost of in warranty repairs; Full documentation,

The Super Elf includes a ROM monitor for pro gram loading, editing and execution with SINGLE STEP for program debugging which is not in-cluded in others at the same price. With SINGLE STEP you can see the microprocessor chip operawith the unique Quest address and data bus ng displays before, during and after executing instructions. Also, CPU mode and instruction cycle are decoded and displayed on 8 LED indicators.

An RCA 1861 video graphics chip allows you to connect to your own TV with an inexpensive video modulator to do graphics and games. There is a speaker system included for writing your own music or using many music programs already written. The speaker amplifier may also be used to drive relays for control purposes

Super Expansion Board with Cassette Interface \$89.95

This is truly an astounding value! This board has been designed to allow you to decide how you want it optioned. The Super Expansion Board comes with 4K of low power RAM fully address able anywhere in 64K with built-in memory protect and a cassette interface. Provisions have been made for all other options on the same board and it fits neatly into the hardwood cabinet alongside the S per Elf. The board includes slots for up to 6K of **EPROM** (2708, 2758, 2716 or TI 2716) and is **fully socketed**. EPROM can be used for the monitor and Tiny Basic or other purposes.

A IK Super ROM Monitor \$19,95 is available as an on board option in 2708 EPROM which has been preprogrammed with a program loader, nd error checking multi file cassette read/write software. (relocatible cassette file) another exclusive from Quest. It includes registe save and readout, block move capability and Break video graphics driver with blinking cursor. points can be used with the register save feature to isolate program bugs quickly, then follow with single step. The Super Monitor is written with

A 24 key HEX keyboard includes 16 HEX keys plus load, reset, run, wait, input, memory proory pro tect, monitor select and single step. Large. on board displays provide output and optional high and low address. There is a 44 pin standard connector slot for PC cards and a 50 pin connector slot for the Quest Super Expansion Board. Power supply and sockets for all IC's are cluded in the price plus a detailed 127 pg. instruction manual which now includes over 40 pgs. of software info, including a series of lessons to help get you started and a music program and graphics target game. Many schools and universities are using the Super Elf as a course

of study. OEM's use it for training and R&D. Remember, other computers only offer Super Elf features at additional cost or not at all. Compare before you buy. Super Elf Kit \$106.95, High address option \$8.95, Low address option \$9.95. Custom Cabinet with drilled and labelled plexiglass front panel \$24.95. MICROCOMPUTERS and PHYSIOLOGICAL SIMULATION

James E. Randall, Indiana University School of Medicine, Bloomington

Foreword by Arthur C. Guyton, University of Mississippi School of Medicine, Jackson

This book provides microcomputer hardware and programs suited for teaching simulations such as nerve action potential, cardiac action potential, cardiovascular system mechanics, and the glucose tolerance test.

"Sorely needed for those of us who are just beginning to adapt microprocessors to teaching applications in Physiology. Dr. Randall is eminently qualified to do this special job. He has interacted for several years with his potential readers through his activities in the American Physiological Society."

Precision Engineered Drives...

Power supply guaranteed for one year.

More Capacitance: Insures stable operation over greater line voltage variations (105-125 Vac.) Scratch resistant steel cover: Primed and baked enamel finish. Virtually eliminates video interference. Color compatible with Radio Shack or Zenith Z89.

> Increased ventilation for additional cooling: Top, side and bottom vents mean lower operating temperatures for longer life.

> > Switch designed with high current ratings (10 AMP).

Transformer designed as integral part of system for best line regulation. Not separately encased to avoid heat build-up providing longer life.

Designed to UL specifications. Wide operating temperature range (0°C to 50°C) Tested to 1500 velts input to output isolation for enhanced power surge protection.

111111

Easy access to terminating resistor for easy field conversion from drive 0 to drive 1, 2, or 3. Extender: Easy plug-in access

3-wire grounded line cord for added operator safety.

With the number of disk drives on the market increasing, more and more people are beginning to ask what's underneath that cover.

The CCI™ series of disk drives have been designed for long life and ease of operation. The features shown above are what set our CCI drives apart from the rest. With a CCI drive you get an integrated professional design!

If you're still not convinced that you get the most for your money with a CCI drive, just ask for our complete specifications sheet. Then, compare our disk drives to anyone else's.

The BYTE Book of Pascal

Edited by

Blaise W. Liffick Based on the growing popularity of Pascal as a programming language, numerous articles, language forums and letters from past issues of BYTE magazine have been compiled to provide this general introduction to Pascal. In addition, this book contains several important pieces of software including two versions of a Pascal compiler - one written in BASIC and the other in 8080 assembly language; a p-code interpreter written in both Pascal and 8080 assembly languages; a chess playing program; and an APL interpreter written in Pascal. \$25.00 Hardcover pp. 342 ISBN 0-07-037823-1

Beginner's Guide for the UCSD Pascal System

by Kenneth L. Bowles Written by the originator of the UCSD Pascal System, this highly informative book is designed as an orientation guide for learning to use the UCSD Pascal System. For the novice, this book steps through the System bringing the user to a sophisticated level of expertise. Once familiar with the System, you will find the guide an invaluable reference tool for creating advanced applications. This book features tutorial examples of programming tasks in the form of self-study quiz programs.

The UCSD Pascal Software Systems, available from SofTech Microsystems Inc, 9494 Black Mountain Road, San Diego CA 92126, is a complete general purpose software package for users of microcomputers and minicomputers. The package offers several interesting features including:

- Programs which may be run without alteration on the General Automation or DEC PDP-11 minicomputers, or on an 8080, 8085, Z80, 6502, 6800, or 9900 based microcomputers.
- Ease of use on a small, single-user computer with display screen and one or more floppy disk drives.
- A powerful Pascal compiler which supports interactive applications, strings, direct access disks, and separately compiled modules.
- A complete collection of development software: operating system, file handler, screen oriented text editor, link editor, etc.

May BOMB Results Floppy Disks

BYTE readers output their interest in Steve Ciarcia's "I/O Expansion for the Radio Shack TRS-80" (page 22) by expanding Steve's rank with another first place. John Hoeppner also interfaced well with readers, receiving a second place for his floppy-disk-controller article (page 72). First place for May was 1.84 standard deviations above the mean, while second was 1.09, closely followed by Gregory J Walker ("Error Checking and Correcting for your Computer," page 250) in third place and Emory Cook ("The Cassette Lives On," page 12) in fourth place.

HSPIN

Ohio Scientific's top of the line personal com-puter, the C8P DF. This system incorporates the most advanced technology now available in standard configurations and add-on options. The C8P DF has full capabilities as a personal computer, a small business computer, a home monitoring security system and an advanced process controller.

Personal Computer Features

The C8P DF features ultra-fast program execution. The standard model is twice as fast as other personal computers such as the Apple II and PET. The computer system is available with a GT option which nearly doubles the speed again, making it comparable to high end mini-computer systems. High speed execution makes elaborate video animation possible as well as other I/O functions which until now, have not been possible. The C8P DF features Ohio Scientific's 32 x 64 character display with graphics and gaming elements for an effective resolution of 256 x 512 points and up to 16 colors. Other features for personal use include a programmable tone generator from 200 to 20KHz and an 8 bit companding digital to analog converter for music and voice output. 2-8 axis joystick interfaces, and 2-10 key pad interfaces. Hundreds of personal applications, games and educational software packages are currently available for use with the C8P DF.

Business Applications The C8P DF utilizes full size 8" floppy disks and is compatible with Ohio Scientific's advanced small business operating system, OS-65U and two types of information manage-ment systems, OS-MDMS and OS-DMS.

The computer system comes standard with a high-speed printer interface and a modem interface. It features a full 53-key ASCI keyboard as well as 2048 character display with upper and lower case for business and word processing applications.

Home Control The C8P DF has the most advanced home monitoring and control capabilities ever offered in a computer system. It incorporates a real time clock and a unique FOREGROUND/ BACKGROUND operating system which allows the computer to function with normal BASIC programs at the same time it is monitoring external devices. The C8P DF comes standard with an AC remote control interface which allows it to control a wide range of AC appliances and lights remotely without wiring and an interface for home security systems which monitors fire, intrusion, car theft, water levels and freezer temperature, all without messy wiring. In addition, the C8P DF can accept Ohio Scientific's Votrax voice I/O board and/or Ohio Scientific's new universal telephone interface (UTI). The telephone interface connects the computer to any touch-tone or rotary dial telephone line. The computer system is able to answer calls, initiate calls and communicate via touch-tone signals, voice output or 300 baud modem signals. It can accept and decode touch-tone signals, 300 baud modem signals and record incoming voice messages. These features collectively give the C8P DF capabilities to monitor and control home functions with almost human-like capabilities. **Process Controller**

The C8P DF incorporates a real time clock, FOREGROUND/BACKGROUND operation and 16 parallel I/O lines. Additionally a universal

accessory BUS connector is accessible at the back of the computer to plug in additional 48 lines of parallel I/O and/or a complete analog signal I/O board with A/D and D/A and multiplexers.

Clearly, the C8P DF beats all existing small computers in conventional specifications plus it has capabilities far beyond any other computer system on the market today.

C8P DF is an 8-slot mainframe class computer with 32K static RAM, dual 8" floppies, and several open slots for expansion

Or get started with a C8P with cassette inter-face, 8K BASIC-in-ROM which includes most of the features of the C8P DF except the real time clock, 16 parallel I/O lines, home security interface and accessory BUS. It comes with 8K static RAM and Ohio Scientific's ultra-fast 8K BASIC in POM It can be avanded to a 8K BASIC-in-ROM. It can be expanded to a C8P DF later. Base price \$950. Virtually all the programs available on disk are also available for the C8P cassette system on audio cassette.
